

SIDEDRESSING NITROGEN FOR MAXIMUM YIELDS

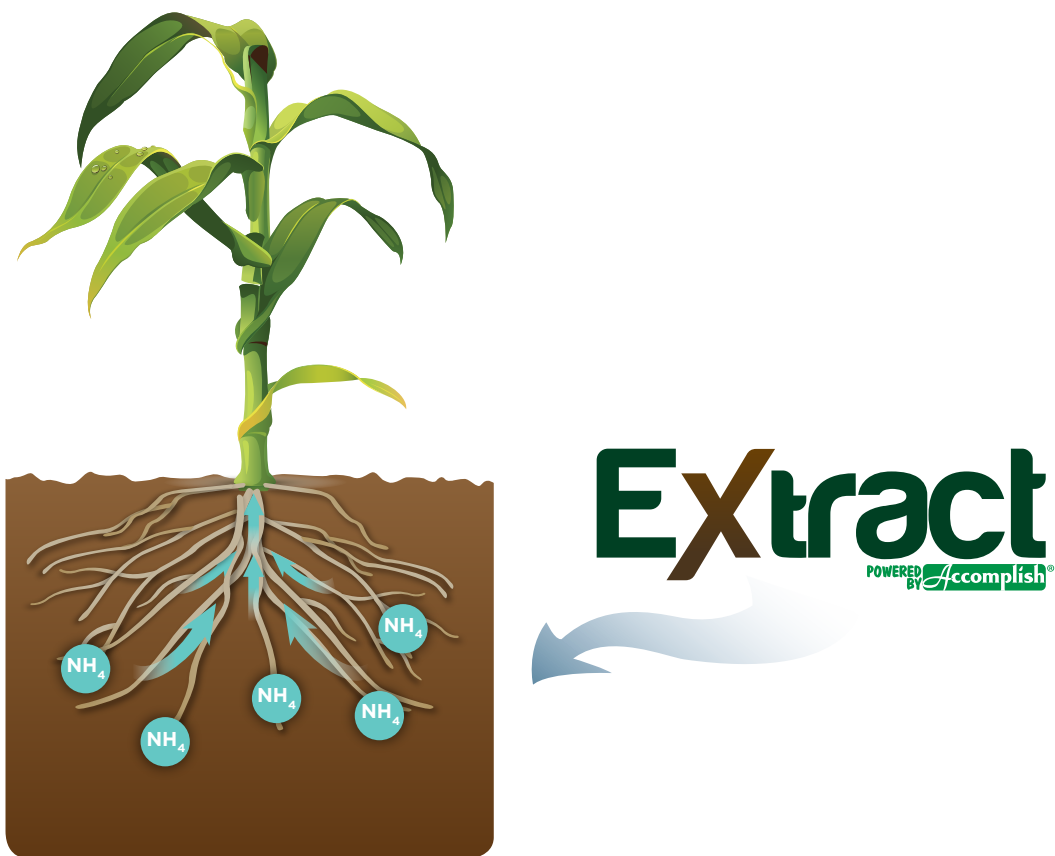

PROBLEM

UAN sidedress is applied right before corn enters the period when nitrogen demand is highest. But, for the crop to uptake and use the applied nitrogen, it must first be converted into a plant-available form, and it must remain available for when the plant needs it most.

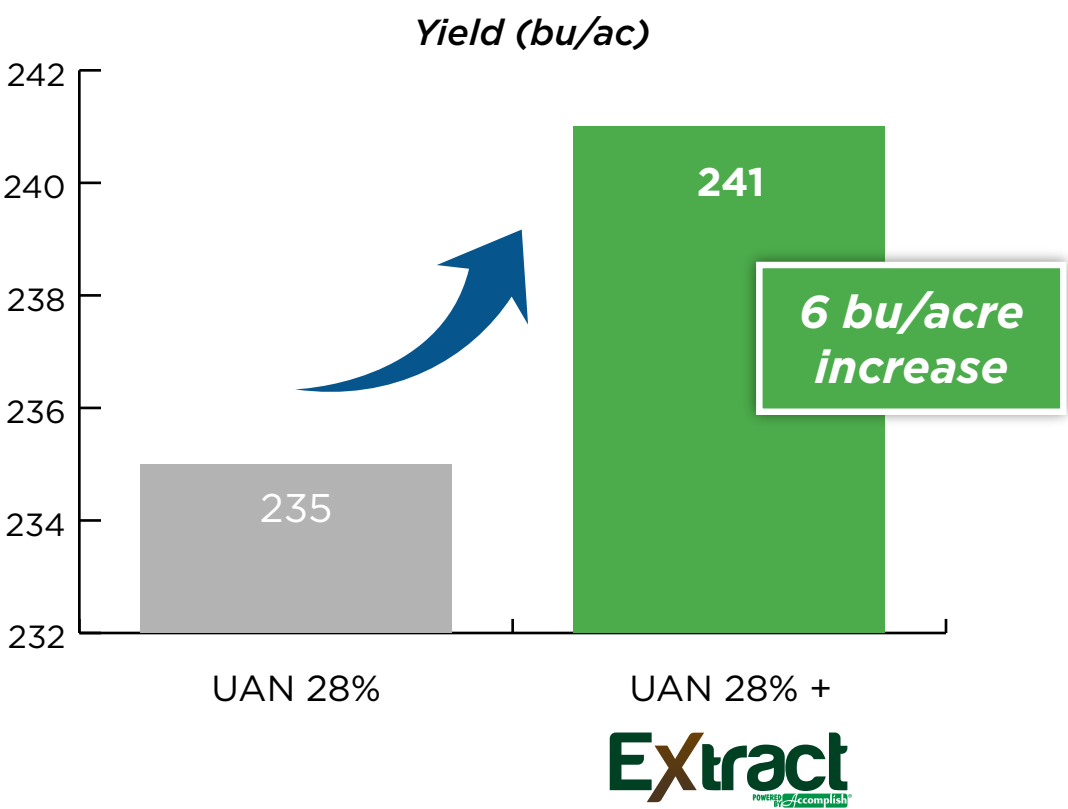

SOLUTION

When applied with UAN sidedress, EXTRACT PBA increases nutrient availability and root growth. It can be used with a nitrogen stabilizer to keep the nitrogen in its most efficiently used form: NH_4^+ .

THE RESULTS?

Better N Use Efficiency and Increased Yields

Corn - New Brunswick, Indiana
