RESULTS:

The company now has an entire site protected in the event of a disaster, as well as a dependable network infrastructure. DP Solutions' services have helped increase the availability and uptime of server applications at their corporate headquarters. As the company seeks to expand their business and alter their network, DP Solutions is there to advise and assist with the adjustment of their network servers' internal architecture.

DISASTER RECOVERY

automobile insurance

CHALLENGE

After a negative experience with their prior disaster recovery provider, this Baltimore-based automobile insurance company sought a new disaster recovery provider who would give them the time and attention they needed. With a high-volume of sensitive data processed on their server, the security of their data was a focal concern. The company wanted to secure their in-house code so that it not only allowed for easy and consistent data transmission, but also managed their data through a protected outlet. The company also requested frequent tests of their disaster recovery plan.

SOLUTION

Along with new hardware for their network servers, the company also obtained DP Solutions' disaster recovery services, which included 24x7x365 tech support and a recovery strategy they could depend on. DP Solutions also helped the client create their own network and assisted with upgrading them to an enterprise-class network by working closely with their team to understand the structure of their in-house code and understanding what their ideal server infrastructure was.

TECHNICALLY SPEAKING

With DP Solutions' disaster recovery services, the organization receives fully managed backups and offsite replication of their data. DP Solutions provided them with new switches, firewalls, malware protection, and a Storage Area Network (SAN). With multiple switches and two firewalls in place, several Internet connections are accessible to their users. the organization also acquired an enterprise-class network to better allow server permanence. The enterprise-class solution regulates the server so that a single switch failure would not cause a network crash or another switch to fail.
