

Cloud-based voice recognition to help reduce turnaround time and transcription costs while improving quality and efficiency of care.

## Voice Recognition Overview

Utilizing voice recognition technology to assist clinicians with documenting the patient's story is essential in today's busy medical practices. Quatris Healthco is pleased to offer our secure, cloud-based voice recognition solution for our athenaPractice customers. Our voice recognition solution is fully integrated with the athenaPractice EMR and built on the Nuance Speech Anywhere Services technology (Dragon), making it highly scalable and ready-to-use.

The voice recognition solution enables the clinician to speak into a microphone and the words and phrases appear in the athenaPractice clinical record. Capabilities also include specialty-specific language models, automated user accent detection, voice-based correction as well as custom vocabularies and templates.

Our voice solution provides cloud-based clinical voice recognition across your existing infrastructure of Windows-based devices, including virtualized and remote-access PCs. As a result, IT requirements are streamlined, and expenses are minimal.

## Voice Recognition Benefits:

- Cloud-based solution completely integrated into athenaPractice.
- Easy to deploy medical speech recognition across the practice while saving IT expense.
- High degree of medical terminology accuracy.
- No training of the application to your voice: excellent recognition even with accented speech.
- Fast documentation – voice recognition can be much faster than templated documentation or typing.
- Great return-on-investment – cost effective compared to traditional dictation services.
- Minimize or eliminate the need for typing (new to voice recognition)
- Excellent recognition accuracy, ability to use custom words, and the same text and graphics macros you use today (existing user of voice recognition).
