Browse and load your corporate logo. Use 1:1.15 aspect ratio and any .jpg or .png with a file size up to 5 MB.

Save after uploading

Make Network Public

The screenshot shows the Tina web interface for configuring a network. The top navigation bar includes the Tina logo, a search bar, and user information for 'Jonah Jameson'. The main content area has a tabbed interface with 'Properties' selected. The 'Properties' tab shows the following configuration:

- Network Name: BugleEngineering
- Network Path: tina5s.com/gmail/BugleEngineering
- Present Network Name: GMAIL
- Creation Date: 2/5/2018 9:56:27 AM
- Public Network:
- Enable Active Directory Integration: Select

On the right side, there is a 'Network Administrators' table with one entry: jonah.jameson197601@gmail.com. Below the table are 'Save' and 'Cancel' buttons. A blue callout box with a green circle '1' points to the 'Public Network' checkbox and contains the text: "Check this box if you want potential Tina users to discover your network online while they are independently signing up for a Tina account." Another blue callout box with a green circle '2' points to the 'Save' button and contains the text: "Save your changes".

Enable Active Directory Integration

1 Tina can integrate with your active directory (if you have one). If you want your user group to login using their Windows ID and password, check this box.

2 Choose LDAP (Lightweight Directory Application Protocol) or Secure LDAP (LDAPS) as the connection protocol between Tina and your domain controller. If you don't know which one to use, see your IT Administrator.

3 Provide your domain address

4 Save your changes

(See Section 104 for information on how to add users once LDAP has been enabled)
