

oceanside
COMPATIBLE™

Twenty-seven year's ago, Oceanside Glass & Tile® started making glass.

Styles change, colors trend, and the Team embarks every new day to turn your recycled bottle glass into marvelous mosaics. With serendipity only a Magic 8 ball might be able to predict, Oceanside Glass & Tile now makes glass for the world its founders pioneered.

For the glass blowers, fusers, stained and mosaic artists; for the hobbyists and master craftspeople alike; for the creators, the imaginers, and those who make life a little more colorful.

In our first Glass Catalog, we stand in awe of how full circle life can be. In sometimes unpredictable ways, we all come back to our roots. Thank you for welcoming us back.

It feels good to be home.

Founders Boyce Lundstrom, Sean Gildea, Don Pettey, and Jon Stokesbary.

Important Information About Using Textured Glass in Fusing

With new glass textures available to warm glass artists, here are several pointers to consider before fusing some of the textured products.

Since the process of fusing involves heating glass to temperatures high enough to melt it, ***not all textured glasses will be useful in all projects, especially in a full fuse.*** Most textured glasses can be lightly slumped and retain their texture while others will retain significant texture in a tack fuse.

The texture in transparent glasses can be used to create intentional bubbles while deeply textured products that are full fused with smooth or other textured sheets may cause unwanted bubbles. Consider your desired final effect before choosing a textured surface.

Filling the channels of a deeply textured glass with paint or fine frit is also an interesting technique. A strong texture with an iridescent or dichroic coating will melt at full fuse in unique ways - redistributing, stretching, or layering the coating as it does.

Using this Catalog

How to Read our Product Codes

We continue to operate two distinct manufacturing processes from our predecessors, Spectrum Glass® and Uroboros Glass®.

The Continuous Ribbon (formerly Spectrum Glass) process allows us to produce high volumes of the smoothest fusible glass on the market, while also preserving unique product lines such as Baroque™, Waterglass™, and Spirit™, among others.

The Hand-Rolled (formerly Uroboros Glass) process lends versatility and incredible artistry to our fusible and art glass product offerings. Fusible accessory glass products - Frit, Stringers, Noodles, and Rods - will continue as part of the product catalog, rounding out your glass needs.

For the convenience of the Spectrum and Uroboros customers that have been using and selling these products for over 40 years, we have decided to preserve the product identification systems (SKUs) of each company. Where we've moved a product from the Hand-Rolled to the Continuous Ribbon, or vice versa, we've made a note within the catalog.

Transparency Values

As you use this catalog, you'll find the glass is organized first by color and then by opacity within each color. Opacity is a measure of how much or how little light can pass through a sheet of glass. We define opacity in the following ways:

Transparent Products - Light can easily pass through these 100% transparent glasses since they don't contain any opaque glass or other light blocking material, such as metallic flakes in Aventurine glasses. Formerly known as Cathedral Products.

Translucent Products - These mixed products are predominantly transparent glass with some opaque glass mixed in, allowing light to pass through in many or most areas.

Semi-Translucent Products - Predominantly opaque glass with some translucent glass mixed in, allowing less light to pass through the sheet or pass through in only small areas.

Opalescent Products - Glasses that are primarily or completely opaque, reflecting most light away but often featuring a luminescent glow when backlit depending on the specific product.

Additional Descriptions - Also shown within each color group are other sub-groups, such as Thin, Thick, Iridescent, and any others that apply.

After the main color grouped section of the Product Catalog, you will find the same sheet glass images grouped by their product family or style. More information about each product family can be found starting on page 30.

TRANSPARENT/CATHEDRAL

Light transmission is unobstructed by the introduction of opalescent glass or other material.

GLASS FAMILIES

The previous portion of the catalog sorted glass into color groups first and then by opacity level, which is very useful. Many of our glasses also belong within families that contain similar products; knowing the full extent of these families can also be useful in glass work. Here you can view all the products contained within each of the various family groups.

SOLID OPALESCENT

Opalescent glass is mostly opaque, yet may display a muted, luminescent glow when backlit (varies by product). Whether a colorful or neutral hue, the rich tones of opalescent glass are a staple in every glass palette.

FRACTURE/STREAMER, FRACTURE/STRINGER, AND COLLAGE GLASS

"Fractures" are flakes made from glass blown thinly then shattered. "Streamers" are hand cast and achieve more random, natural patterns in the glasses below. "Stringer" is machine pulled stringer that is arranged on sheets in a more regular, graphic pattern.

IRIDESCENT

Iridescent glasses have been flash-fired with a micro-thin layer of metallic crystal to create lustrous, jewel-like colors in reflected light.

REACTIVE GLASS

Chemical components in these glasses react with substances in certain other glasses to create color reactions where the two glasses melt together. Please see the website for further information on using reactive glasses.
