

## Preventive Maintenance

Once production machinery or the associated control device unexpectedly shuts down, the whole maintenance department moves into scramble mode.

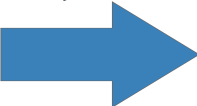

Here are just a few tips to keep your system running smooth during the winter months

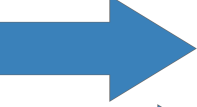

Calibrate combustion system & confirm compliance to current safety standards

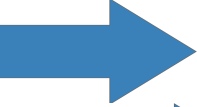

Maintain fan - bearings, belts, cleaning

RTO media inspection & valve tolerance measurement

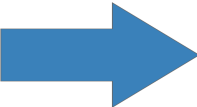

Calibrate instruments; check and clear sensing lines

Damper check - bearing & linkage adjustments

Order critical spare parts

House keeping - clean access areas; clean control cabinet filters; have O&M manuals up to date on accessible; inspect complete system for air leaks
