

Before GreenScreen Removal

After GreenScreen Removal

After digital background is applied

What is Greenscreen?

When photographing on 'greenscreen', screens that are a solid shade of a certain type of green are used as backdrops for the subject. Using an exact shade of chroma green allows us to remove the solid color background and apply a digital background of the subject's choosing.

Though it is difficult to match the exact shade of green in a subjects clothing, we recommend you do not wear green on picture day.
