Bridging your Information Gaps with Systemware Content Cloud

Bridging the gaps between siloed content and its various repositories is one of the biggest challenges in information management today. Many organizations store content in aging and disparate repositories, shared drives, mobile devices, and removable storage media, creating an administration and maintenance nightmare. Thus, the unnecessarily challenging process of finding content begins.

Compounding on this challenge, no two organizations are identical or have the same needs when it comes to content related tasks and processes. For these reasons, at Systemware we concentrate our efforts on the information needs of some of the world's largest companies spanning a variety of industries such as financial services, insurance, retail and healthcare. We respect those things that make an organization's information landscape complex and unique and specifically focus our innovation efforts on creating solutions flexible and agile enough to meet these unique needs.

Systemware Content Cloud is our on-premise, hybrid or hosted solution that manages information management needs while empowering business ecosystems. Systemware Content

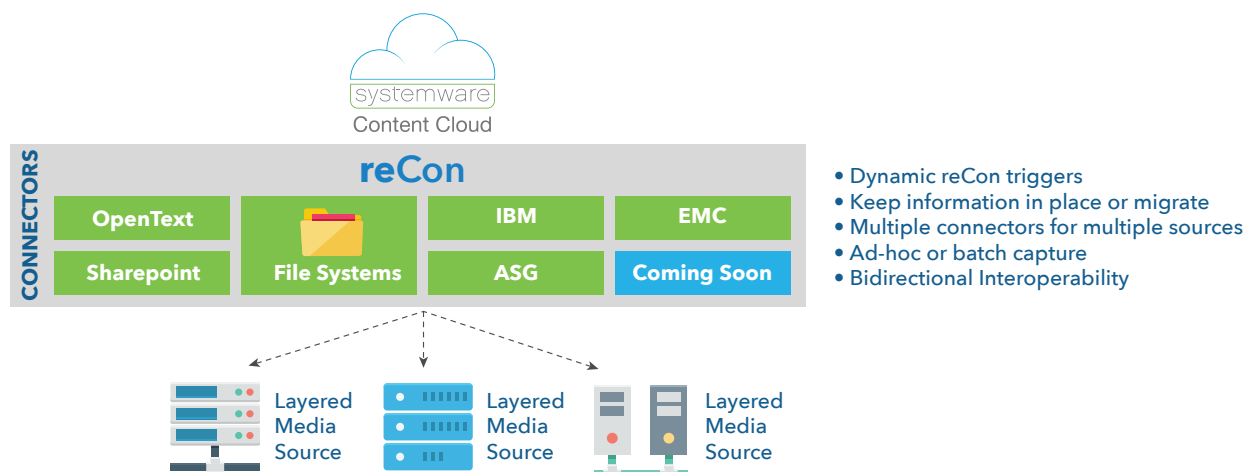

Cloud you can “connect the dots” of your information silos whether across firewalls or systems to empower people and enterprises with the information at the right time and in the right context. Our intelligent content network transcends firewalls to connect people and enterprises to curated information in the context of their work.

Using Systemware Content Cloud, you can enable content not only stored natively in our solution, but you will also have visibility into your other legacy systems and silos of information throughout your organization. Our goal is to enable you with your information assets, no matter where it exists in your organization.

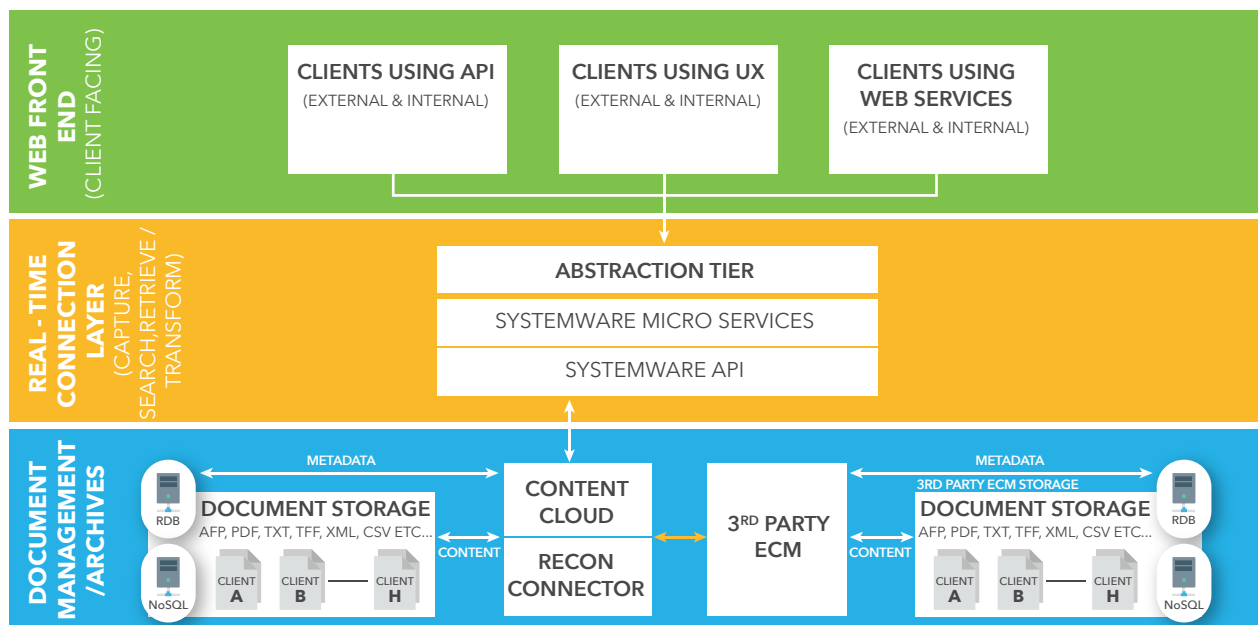

Systemware reCon allows you to identify, connect, migrate and control your information assets once siloed in legacy systems buried in cumbersome SharePoint implementations or hidden in the wilds of your filesystems.

There are a variety of reasons that Systemware is called upon to help our customers. Whether they are looking to get a handle on the infamous “P:” drive, are struggling with having information across many systems distributed throughout their organization, are looking for a better way to control an implementation, are being “held hostage” or experiencing lock-in from historical and legacy software solutions. ‘If it isn't broke don't fix it’ is proving to be more and more ineffective as a means to meet an organizations needs both in features or economics. Bottom line it costs a lot to support and maintain multiple aging systems doing similar things while lacking the ability to flex with your business into the future.

Systemware Content Cloud provides you with immediate value to connect with you with information without disrupting your business, partners or end users. You will have the flexibility to determine when it is right to connect, integrate, migrate, or simply control your information assets in place whether in legacy systems, buried in cumbersome SharePoint implementations, or hidden in the wilds of your file systems.

Our flexible infrastructure provides companies with an always-available intelligent content network that is reliable... scalable... and equally as important... usable. The “connectors” are created using our proven methodology that we have used over the years for gleaning information from or connecting to third party and legacy applications. Those listed are merely examples of systems we have worked with in the past and not an exhaustive list of the possibilities. Systemware has several connectors that are “coming soon” including cloud-based, social media and other information management system connectors.

- reCon **receives** request
- reCon **integrates** with existing repositories
- reCon **retrieves** content
- reCon **transforms** and **returns** content securely in your desired format

We do not simply pull information from those applications, but can also deliver content TO those applications whether an ECM, CRM, ERP or Customer Portal. Our advanced architecture and API's enable both types of needs while keeping a focus on the future.

Our Intelligent content network exists on top of your content archives, providing a seamless integration and full audit trail including activity reporting.

Systemware Content Cloud's reCon abstraction tier allows for a proven integration tier, and provides visibility into your various content silos, legacy systems and archives. This means an

end-user, requesting information will not be required to understand the “inner workings” of the solution. Users simply search through your desired user interface and Content Cloud, through dynamic triggers, curates and transforms the information. Keep in mind, 3rd party information can either be left in place or migrated to Systemware Content Cloud.

Bi-directional interoperability means you can push or pull information from your entire information landscape. We feel strongly that our architectural approach or “abstraction tier” provides organizations the flexibility to focus on their own innovations versus wasting time reinventing multiple information management connections. All requests coming into Systemware Content Cloud are standardized, removing integration complexity. What this means is that a “SEARCH”, “RETRIEVE”, or “STORE” request will be submitted the same, no matter what back end systems are being interrogated. Systemware Content Cloud takes these requests and “translates them” then returns or stores the results in the desired format (such as PDF). Our only goal is to simplify how you enable your business with your information.

Systemware solutions are highly responsive to our customer’s needs. We take pride in that much of the input we receive for our product direction comes directly from our customer base, including some of the largest companies in the world with some of the most complex content-related needs.
