

Gimmel Altitude

Discover, remediate, and classify
content in all your corporate data
sources.

Altitude simplifies the management of unstructured data across the enterprise by discovering and analyzing content in all corporate data sources to reduce risk and improve organizational efficiency. Altitude allows users to easily gain visibility into file content in order to analyze your files, eliminate unnecessary data, and govern information properly.

Key Benefits

Mitigate risk buried in unstructured content

When personally identifiable information (PII) and other sensitive data is left unmanaged, it can become lost in corporate data sources. This poses great risks for organizations. Altitude mitigates these risks by identifying files that contain sensitive information and applying the appropriate metadata to govern content according to your information governance program.

Eliminate redundant, obsolete, and trivial (ROT) information to improve user efficiency

Gartner, a global leader in research and advisory, estimates that nearly 80% of data in the average organization is unstructured. Much of this content is not critical to business operations and subsequently bloats content sources. Altitude provides the ability to eliminate unnecessary content by:

- Discovering redundant or duplicate files
- Removing obsolete files kept beyond their retention date
- Removing trivial files that should not be kept

Govern all data to comply with organizational policies

Information governance programs that include unstructured data are more likely to succeed in organizations. As information continues to grow at a rapid rate, managing this content in multiple sources is no easy task. Altitude analyzes, tracks, and reports on unstructured data for you to reveal detailed metadata and contextual information, providing you with the ability to:

- Locate unstructured files that could potentially be valuable to your business
- Create policies to consistently govern data
- Comply with regulatory requirements
