

Vulnerability Assessment

Get a complete view of your critical cyber risks and network health with a comprehensive Vulnerability Assessment from IGI.

What is a Vulnerability Assessment?

Everyone has critical vulnerabilities in their network that go undetected, giving cyber criminals the perfect opportunity to target your organization. With a Vulnerability Assessment from IGI, we'll identify those critical vulnerabilities and provide an overview of the remediation needed.

Since vulnerabilities are the cause of most cyber attacks, there are a number of benefits of performing a Vulnerability Assessment:

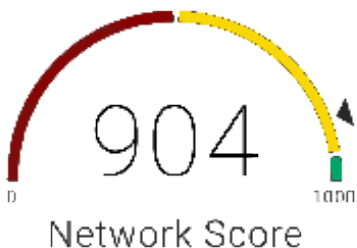

- A comprehensive view of your network's security health and other recommendations
- Clearly define existing vulnerabilities
- Patch and remediate to mitigate risks
- Lessen likelihood of security breaches and ransomware attacks

Why choose a Vulnerability Assessment?

Vulnerability Assessments are the first step to achieving a strong security posture. By providing a baseline understanding of your current security status, you can better deploy other security measures and solutions.

Organizations of every size in every industry can benefit from a Vulnerability Assessment to:

- Fingerprint every device in your network—physical, virtual, mobile, fixed, or IoT device—for a complete inventory
- Evaluate both your internal and external-facing IPs and websites for a complete security picture to prioritize remediation
- Help meet compliance and audit requirements

Contact us to learn how a network health assessment can help improve your security posture.
