

## Build a shed the Alpine way

A tidy Alpine kitset shed ready to be delivered

**A**lpine Buildings supply a large range of high-quality clearspan buildings and sheds to farmers, contractors, and builders around New Zealand.

The company is committed to supplying the fastest and easiest-to-build kitset farm sheds in New Zealand, without compromising on quality.

"Alpine Buildings is one of the longest established companies in its field, with more than 20 years' experience in delivering only the best," product development and innovations manager Terry Forrest says.

### Why build with Alpine?

A key feature of the Alpine design is the birdproof steel rafter system, which has proven its cost-effectiveness and time-saving benefits for many clients.

"The unique clearspan steel rafter system has been designed and improved over a long time and outperforms any other pole shed design on the New Zealand market.

"Being the first company to supply hot dip galvanising on all standard spans, these rafters are a breakthrough towards stronger, better looking, and longer lasting sheds."

The timber purlins are simply bolted to pre-welded joist hangers on the side of the steel rafters, meaning there is nowhere for any birds to perch or nest in the roof cavity.

Other standout features include the pre-dried timber, plumb-cut beams, superb quality control, free delivery direct to the building site, and superior

after-sales support. Alpine Building's team of more than 20 staff is dedicated to delivering top-quality service and will even arrange the building consent for you.

### Construction

Alpine Buildings has a proud track record of structural success.

"Alpine structures are designed and engineered specifically for the wind and snow loadings at your site and have outperformed other structures when strength really matters.

"Alpine's commitment to safety, strength, and reliability is second to none and we take great pride in supplying the highest quality products available."

All timber is H3.2 tanalised or greater, and poles are H5 treated for 50 years' protection. The timber roof purlins are stacked to dry for around six months before packing into a kitset, making it a lot lighter, easier, and safer to build with. Compared to all-steel sheds, the strong timber framing provides a quieter and

The unique Alpine steel rafter design

more naturally temperature controlled environment. "Being the fastest sheds on the market to erect, many builders now buy directly from Alpine because of the time and money saved."

Once the building consent is approved, the shed can typically be delivered within two to three weeks. This can be brought forward or put off depending on the client's situation.

### The hard work is already done

Everything is thought of when an Alpine kit shed is supplied. The kitset pack will turn up direct to site with not a single screw missing, thanks to Alpine's vigorous quality control and triple checking procedures. The kitset sheds are well organised and easy to set up.

A West Coast farmer who recently bought his 12<sup>th</sup> Alpine kitset shed sums up: "We love putting up Alpine sheds. They are tidy, well organised, on time, well priced, no problem sheds. They're great sheds and good people to deal with, too."

Few would argue that proven durability combined with world-class engineering and innovation have earned Alpine Buildings the reputation as one of the best building investments you can make – the reason so many people choose Alpine.
