

MAINFRAME SECURITY & COMPLIANCE

Does your SIEM strategy encompass your company's mainframe? Or, is it limited to Windows, Linux and UNIX platforms? SIEM platforms were not purpose built for the z/OS operating system, leaving a gap in your compliance strategy that could put your mainframe systems - and your company - at risk. However, by handling your mainframe data in a proactive and secure manner, you can maximize your security and compliance strategy.

MEAS™, the Mainframe Event Acquisition System™ MEAS™ was designed from the ground up to enable mainframe users to collect, analyze and log data real time, through seamless integration with the leading Event Management (EM) and Security Information and Event Management (SIEM) technologies – Arcsight, LogRhythm, McAfee/Intel Security ESM, IBM QRadar, Splunk and others. The z/OS platform is not going away like many predicted. Seventy percent (70%) of all business data is still processed by a mainframe. Increasingly, mainframes are subject to compliance requirements and increased scrutiny that require the collection of events and logs in real time. The SIEM technologies were not designed to collect mainframe data real time at the level of detail needed to meet regulatory compliance requirements.

MEAS™ is designed to collect, analyze and log their event metrics on the z/OS platform real time in the same way you are monitoring your distributed system. Coupled with you EM or SIEM TECHNOLOGY, MEAS™ will assist in the detection of 'suspicious' activities before they subject your company to fines and penalties. Leveraging the mainframe data that MEAS™ provides, you can now generate a full complement of packaged reports for the CCO, CSO, CRO or CISO. No other product on the market focuses exclusively on mainframe exposure and risk. Once installed, MEAS™ customers can rest assured that their mainframe systems are just as secure and compliant as their Windows, UNIX, and Linux counterparts.

MEAS™ WAS DESIGNED TO ALLOW USERS TO COLLECT THE FOLLOWING TYPES OF MAINFRAME METRICS AND EVENTS IN REAL-TIME:

- RACF, TSS, ACF-2 Security Events
- Dataset Activity
- Database Events (DB2, IMS, IDMS, DATACOM)
- Transaction Processing FTP Activity
- RMF
- SMP/E
- APF
- z/OS Console Messages
- Job Abend Events
- Software Maintenance Monitoring
- CA Top Secret Audit File Activity
- WebSphere Application Server
