Managed Technology Partner

The technology ecosystem of an organization can be complex, often with multiple solutions serving various purposes, and provided by different vendors. Management and oversight of those systems can be difficult and requires the experience and an understanding of technology management.

Like the conductor of an orchestra, effective technology management requires a single source with a centralized perspective of all aspects of technology within an organization. As a Managed Technology Partner to your organization, OSIbeyond's IT Operational Management Model ensures that all technologies are operating in a unified manner to provide efficient and seamless service to end users.

Why Do You Need a Managed Technology Partner?

For many organizations, internal resources for managing technology are limited or may not exist. In addition, having multiple vendors (IT support, Telephony, Cloud Services, etc.) can be difficult to manage and create significant inefficiencies and their associated costs.

As your Managed Technology Partner, OSIbeyond is the single source for all aspects of your technology from strategy to support. This operating model benefits your organization by having one vendor as the central source for all technologies, that can be held accountable (no finger pointing), and streamline technology management.

What is the IT Operational Management Model?

OSIbeyond's IT Operational Management Model is designed to provide a holistic solution to managing core technologies within an organization. This includes strategy, support, cloud, communications, security, and web services all designed to work harmoniously together. By having a single source provider, various aspects of technology within the organization can be planned, implemented, and supported together, rather than having standalone solutions and vendors.
