## **WARRANTY**

The following is an abbreviated version of Trenton Systems' warranty policy for PICMG® 1.3 products. For a complete warranty statement, contact Trenton or visit our website at: [www.trentonsystems.com/about-us/company-policies/](http://www.trentonsystems.com/about-us/company-policies/).

Trenton PICMG® 1.3 products are warranted against material and manufacturing defects for five years from date of delivery to the original purchaser. Buyer agrees that if this product proves defective Trenton Systems, Inc. is only obligated to repair, replace or refund the purchase price of this product at Trenton Systems' discretion. The warranty is void if the product has been subjected to alteration, neglect, misuse or abuse; if any repairs have been attempted by anyone other than Trenton Systems, Inc.; or if failure is caused by accident, acts of God, or other causes beyond the control of Trenton Systems, Inc. Trenton Systems, Inc. reserves the right to make changes or improvements in any product without incurring any obligation to similarly alter products previously purchased.

In no event shall Trenton Systems, Inc. be liable for any defect in hardware or software or loss or inadequacy of data of any kind, or for any direct, indirect, incidental or consequential damages arising out of or in connection with the performance or use of the product or information provided. Trenton Systems, Inc.'s liability shall in no event exceed the purchase price of the product purchased hereunder. The foregoing limitation of liability shall be equally applicable to any service provided by Trenton Systems, Inc.

## **RETURN POLICY**

A Return Material Authorization (RMA) number, obtained from Trenton Systems prior to return, must accompany products returned for repair. The customer must prepay freight on all returned items, and the customer is responsible for any loss or damage caused by common carrier in transit. Items will be returned from Trenton via Ground, unless prior arrangements are made by the customer for an alternative shipping method

To obtain an RMA number, call us at (800) 875-6031 or (770) 287-3100. We will need the following information:

- Return company address and contact
- Model name and model # from the label on the back of the product
- Serial number from the label on the back of the product
- Description of the failure

An RMA number will be issued. Mark the RMA number clearly on the outside of each box, include a failure report for each board and return the product(s) to our Utica, NY facility:

- Trenton Technology Inc.
- 1001 Broad Street
- Utica, NY 13501
- Attn: Repair Department

Contact Trenton Systems for our complete service and repair policy.

## **TRADEMARKS**

IBM, PC/AT, VGA, EGA, OS/2 and PS/2 are trademarks or registered trademarks of International Business Machines Corp.

AMI and APTIO are trademarks of American Megatrends Inc.

Intel, Xeon, Intel Core, Intel AMT, Intel TXT, Intel Hyper-Threading Technology and Intel Virtualization Technology are trademarks or registered trademarks of Intel Corporation.

MS-DOS and Microsoft are registered trademarks of Microsoft Corp.

PICMG, SHB Express and the PICMG logo are trademarks or registered trademarks of the PCI Industrial Computer Manufacturers Group.

PCI Express is a trademark of the PCI-SIG

All other brand and product names may be trademarks or registered trademarks of their respective companies.

## **LIABILITY DISCLAIMER**

This manual is as complete and factual as possible at the time of printing; however, the information in this manual may have been updated since that time. Trenton Systems, Inc. reserves the right to change the functions, features or specifications of their products at any time, without notice.

**HANDLING PRECAUTIONS**

---

**WARNING:** This product has components that may be damaged by electrostatic discharge.

---

To protect your system host board (SHB) from electrostatic damage, be sure to observe the following precautions when handling or storing the board:

- Keep the SHB in its static-shielded bag until you are ready to perform your installation.
- Handle the SHB by its edges.
- Do not touch the I/O connector pins.
- Do not apply pressure or attach labels to the SHB.
- Use a grounded wrist strap at your workstation or ground yourself frequently by touching the metal chassis of the system before handling any components. The system must be plugged into an outlet that is connected to an earth ground.
- Use antistatic padding on all work surfaces.
- Avoid static-inducing carpeted areas.

**RECOMMENDED BOARD HANDLING PRECAUTIONS**

This SHB has components on both sides of the PCB. Some of these components are extremely small and subject to damage if the board is not handled properly. It is important for you to observe the following precautions when handling or storing the board to prevent components from being damaged or broken off:

- Handle the board only by its edges.
- Store the board in padded shipping material or in an anti-static board rack.
- Do not place an unprotected board on a flat surface.

## Before You Begin

### INTRODUCTION

It is important to be aware of the system considerations listed below before installing your THD8141 (8141-xxx) SHB. Overall system performance may be affected by incorrect usage of these features.

### DDR3-1600 MEMORY

Trenton recommends unbuffered ECC PC3-12800 or PC3-10600 DDR3 memory modules for use on the THD8141. These unbuffered ECC registered (64-bit) DDR3 DIMMs must be PC3-12800 or PC3-10600 compliant. Unbuffered non-ECC DDR3 DIMMs are also supported on the THD8141 SHB, but you cannot mix the two different memory types on the same board.

### NOTES:

- To maximize memory interface speed, populate each memory channel with DDR3 DIMMs having the same interface speed. The SHB will support DIMMs with different speeds, but the memory channel interface will operate speed of the slowest DIMM.
- All memory modules must have gold contacts.
- The SHB supports the following memory module memory latency timings:
  - 9-9-9 for 1333MHz DDR3 DIMMs
  - 11-11-11 for 1600MHz DDR3 DIMMs
- Populate the memory sockets starting with memory channel A and begin by using the DIMM socket closest to the CPU first. Refer to the THD8141 board layout drawing and populate the memory sockets using the population order illustrated in the chart below:

Population order <sup>#</sup>	CPU1
1	BK0A
2	BK1A
3	BK0B
4	BK1B

<sup>#</sup>Using a balanced memory population approach ensures maximum memory interface performance. A “balance approach” means using an equal number of DIMMs on the THD8141 SHB whenever possible.

The memory DIMMs on the SHB connect directly to the CPU and at least one memory module must be installed on the board.

### PCI EXPRESS 3.0 LINKS AND PICMG® 1.3 BACKPLANES

The PCI Express® links A0, A2 and A3 on the THD8141 connect to PCI Express 3.0 retimers and the retimers connect directly to the Haswell processor. PCIe 3.0 retimers are used to maximize signal integrity regardless of where an end-point device is located on a PICMG 1.3 backplane. The PCIe links can operate as either PCI Express 3.0, 2.0 or 1.1 links based on the end-point devices on the backplane that are connected to the SHB. In addition to automatically configuring themselves for either PCIe 3.0, 2.0 or PCIe 1.1 operations, the links also configure themselves for either graphics or server-class operations. In other words, the multiple PCIe links from the processor (links A0, A2 and A3) can be combined into a single x16 PCIe electrical link or a combination of one x8 and two x4 links on a backplane. The CPU’s PCIe links may train down to x1 links, but cannot bifurcate into multiple x1 links. The PCIe link (B0) is a PCIe 2.0 interface that comes from the board’s PCH. Link B0 has a x4 default configuration and can automatically bifurcate into four, x1 PCIe links. Refer to the *PCI Express® Reference* chapter and to *Chapter 4 - PCI Express Backplane Usage* of this manual for more information.

### PICMG 1.3 BACKPLANE USAGE WITH THE THD8141

THD8141 combo-class, PICMG 1.3 system host board supports the standard’s optional SHB-to-backplane USB (4) and Gigabit Ethernet (1) interfaces. Both 3<sup>rd</sup> party industry standard PICMG 1.3 backplanes as well as a variety of Trenton backplanes are compatible with the THD8141 including the Trenton BPG8194, BPC8219, BPG8155, and the BPG8032. There are several backplanes not recommend for use, see the [Tech Info – Trenton PICMG 1.3 Backplanes Compatible with the THD8141 on-line document](#) or *Chapter 4, PCI Express Backplane Usage* for more details.

## POWER CONNECTION

The PICMG® 1.3 specification supports soft power control signals via the Advanced Configuration and Power Interface (ACPI). The THD8141 supports these signals, controlled by the ACPI and are used to implement various sleep modes. When control signals are implemented, the type of ATX or EPS power supply used and the operating system software will dictate how system power should connect to the SHB. It is critical that the correct method be used. Refer to - *Power Connection* section in the THD8141 manual to determine the method that will work with your specific system design. The *Advanced Setup* chapter in the manual contains the ACPI BIOS settings.

## MOUSE/KEYBOARD “Y” CABLE

Many of the legacy I/O connections that previously required an optional IOB33 board have been incorporated into the THD8141 design. Unless you need a parallel printer port, you should not need an IOB33 in your THD8141-based system. (*Note: the current THD8141 BIOS does not support the IOB33 or MPE40 floppy port interface.*) If you have an IOB33 I/O board in your system and you are using a “Y” cable attached to the bracket mounted mouse/keyboard mini Din connector, be sure to use Trenton’s “Y” cable, part number 5886-000. Using a non-Trenton cable may result in improper SHB operation.

## SATA RAID OPERATION (WINDOWS O/S SETUP)

The Intel® C226 Platform Controller Hub (PCH) used on the SHB features Intel® Rapid Storage Technology (Intel® RST) and requires a several unique drivers. A [.zip file](#) is available on the Trenton Systems website to help you configure the SATA ports as RAID drives connected to the THD8141 while taking advantage of the PCH’s drive array management.

If you would like your system to provide you with an immediate notification of a failed drive in the RAID array then the “Hot Plug” setting on the Advanced/SATA THD8141 BIOS screen needs to be ENABLED for each drive in the array. If this BIOS setting is DISABLED a drive failure, notification alert may take several minutes or even longer if there is no hard drive activity on the RAID array.

## DVI-D AND ANALOG VIDEO PORTS

The THD8141 offers both a DVI-D and an analog video port. The digital DVI-D port is a vertical port mounted directly on the SHB. This port is useful in system designs that incorporate a flat panel LCD display directly into the system enclosure. The ports may run simultaneously; however, the specific dual monitor implementation is a function of the system’s operating system and video driver parameters. Like the SATA RAID file a [THD8141 video driver file](#) is available under the DOWNLOADS tab of the [THD8141 product detail webpage](#).

## INTEL® AMT 9.0

Intel® AMT 9.0 is supported on the THD8141 and includes useful features for managing clients remotely. Windows .Net Framework 3.5 or higher must be installed to avoid AMT x.x “unknown device” errors. Serial port console redirect and IDE-R are not currently supported in AMT 9.0 on the THD8141.

## BIOS

The THD8141 features the Aptio® 4.x BIOS from American Megatrends, Inc. (AMI) with a ROM-resident setup utility called the Aptio Text Setup Environment or TSE. (*Note: the SHB’s current THDES008 BIOS has the Hibernate and Sleep states disabled.*) Details of the Aptio TSE are provided in the separate *THD814 BIOS Technical Reference* manual.

## OPERATING SYSTEMS

Trenton Systems has successfully tested the THD8141 system host board with a wide variety of operating systems including Linux (Red Hat RHEL, Centos and SUSE), Windows® Win7 (32 or 64-bit), Windows® 2008 Server 64, Windows® Win8.1 64, Windows® 2012 Server 64, and Oracle® Solaris 11. However, there are some operating systems that Intel® does not recommend for use with the board’s Haswell processor and Lynx Point PCH architecture, notably, Windows® XP (32 or 64-bit), and Windows® 2003 Server.

## FOR MORE INFORMATION

Refer to the appropriate sections *THD8141 Hardware Technical Reference Manual*. The BIOS and hardware technical reference manuals are available under the **Downloads** tab on the [THD8141 web page](#).

## Chapter 1 Specifications

### Introduction

The THD8141 is a combo-class, PICMG® 1.3 system host board featuring the choice of a long-life / embedded, Intel® Xeon® E3-1200 v3 Series, Intel® Core™ i7-4790S, Intel® Core™ i5-4590S or Intel® Core™ i3-4330TE processor formally known as Haswell. These processors utilize a 22nm micro-architecture, and have a DDR3-1600 integrated memory controller that supports two, dual-channel DDR3-1600 memory interfaces. The THD8141 supports four DDR3 DIMM sockets. With 4GB, DDR3 DIMMs the total system memory capacity for a THD8141 is 16GB and doubles to 32GB using 8GB DDR3 DIMMs.

PCI Express 3.0 links form the off-board interfaces on the THD8141's edge connectors including the B0 link from the board's Intel® C226 Platform Controller Hub or PCH. PCIe 3.0 link retimers are utilized in the SHB design for the PCI Express links routed from the board's processor. The THD8141 supplies the twenty PCI Express 3.0 interface links needed for a PICMG 1.3 compliant server or graphics-class backplane plus an additional x1 PCI Express 2.0 interface for use on selected PICMG 1.3 backplanes via an optional plug-in card called the Trenton IOB33 or MPE40 module. All THD8141 links support auto-negotiation with automatic link training and may also operate as PCI Express 2.0 or 1.1 electrical interfaces. This SHB design also supports the PICMG 1.3 optional PCI 32-bit/33MHz serial interface on edge connector D.

Video and I/O features on the THD8141 boards include:

- Dual video ports (one DVI-D and one VGA analog) that are driven with the internal Graphics Processing Unit inside the PCH
- PCIe Mini-Connector supports industry standard PCI Express Mini Cards
- Three Gigabit Ethernet interfaces with two on the I/O plate and one available for use on a PICMG 1.3 compliant backplane or over a cable for Intel® AMT 9.0 support
- Six SATA/300 ports that can support independent drives or RAID drive arrays
- Ten USB interfaces (4, USB3.0 and 6, USB 2.0)
- An RS232 high-speed serial port and a configurable RS232/422/485 serial interface port
- PS/2 Mouse and Keyboard Header
- Integrated TPM 1.2 for Trusted Computing applications

The listing below summarizes the targeted embedded processors supported on the THD8141 board.

<u>Model #</u>	<u>Model Name</u>	<u>Speed</u>	<u>Intel CPU Number</u>
<b>Intel Xeon Processor (Haswell - WS) - Quad Core, 8MB cache, H-T, VT, TXT, ECC*:</b>			
8141-002	THD/2.3HR8	2.3GHz	E3-1268L v3
8141-006	THD/3.5HR8	3.5GHz	E3-1275 v3
* H-T = Intel Hyper-Threading, VT = Intel Virtualization Technology, TXT = Intel Trusted Execution Technology, ECC Memory Support			
<b>Intel Xeon Processor (Haswell - WS) - Quad Core, 8MB cache, VT, TXT, ECC:</b>			
8141-013	THD/3.2H8	3.2GHz	E3-1225 v3
<b>Intel Core i7 Processor (Haswell - DT) - Quad Core, 8MB cache, H-T, VT, TXT:</b>			
8141-026	THD/3.2GHRN8	3.2GHz	Core i7-4790S
<b>Intel Core i5 Processor (Haswell - DT) - Quad Core, 6MB cache, VT, TXT:</b>			
8141-045	THD/3.0GHN6	3.0GHz	Core i5-4590S
<b>Intel Core i3 Processor (Haswell - DT) - Dual Core, 4MB cache, H-T, VT, ECC:</b>			
8141-073	THD/3.3DYR3	2.4GHz	Core i3-4330TE

Additional embedded and non-embedded processor options are available for use on the THD8141 system host board.

## Features

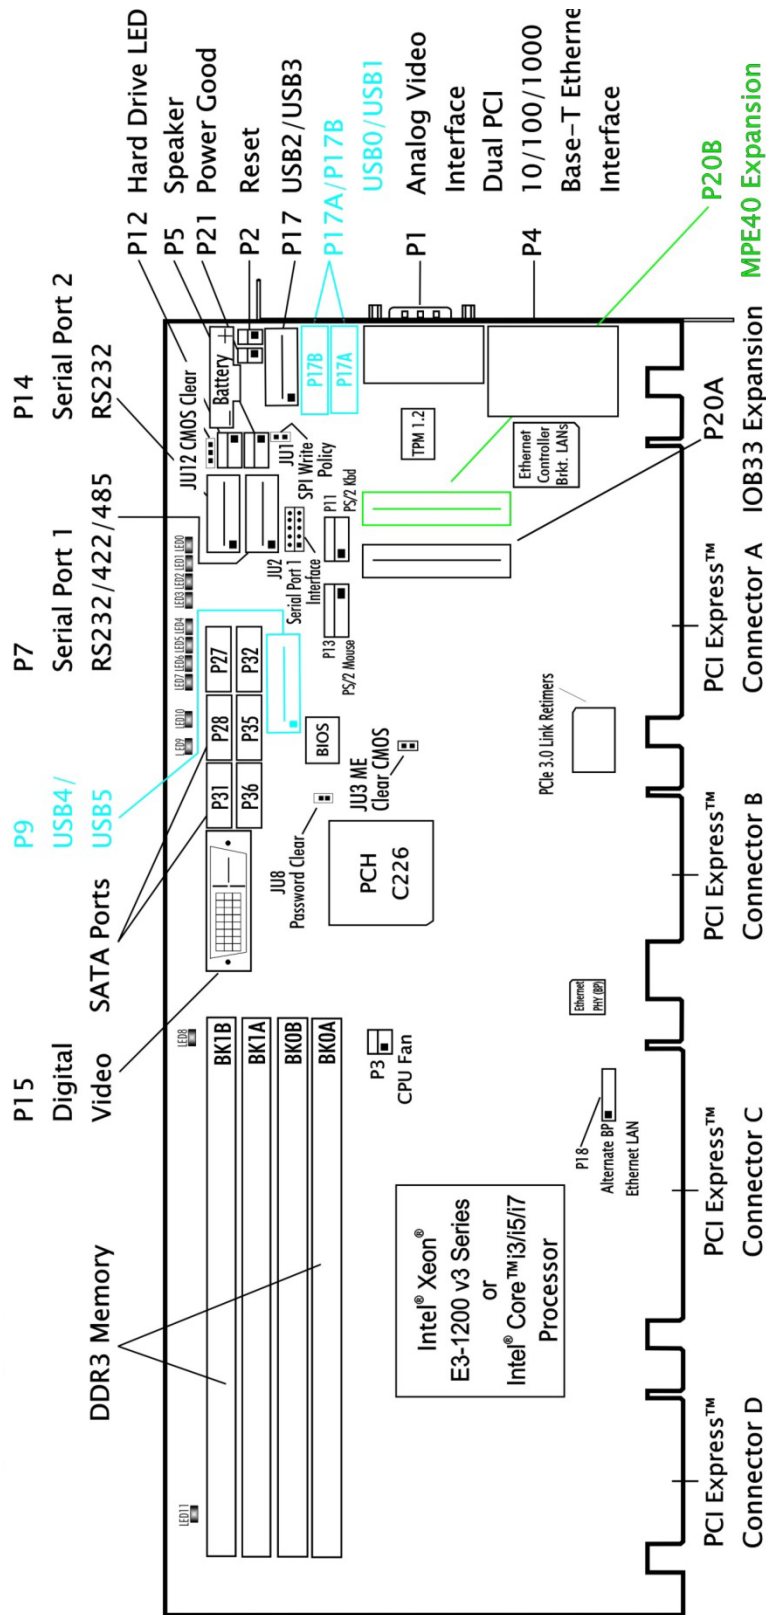

- Intel® Xeon® E3-1200 v3 Series Processors (Haswell- WS)
- Intel® Core™ i7-4790S, Intel® Core™ i5-4590S & Intel® Core™ i3-4330TE Processors (Haswell – Desktop [DT])
- Intel® C226 Platform Controller Hub (Patsburg)
- Direct PCI Express® 3.0 links from the processor to the board's edge connectors
- A Combo-class SHB that is compatible with PCI Industrial Computer Manufacturers Group (PICMG) 1.3 Specification
- THD8141 provides a total of 21 lanes of PCI Express for off-board system integration
- Direct DDR3-1600 Memory Interfaces into the Haswell Processor
- Four DDR3 DIMM sockets capable of supporting up to 32GB of system memory with 8GB DDR3 DIMMs and 16GB maximum capacity with readily available 4GB DDR3 DIMMs
- Dual Digital and Analog video interfaces utilizing Intel® HD Graphics 4600
- WiFi, SSD on-board storage and other additional video and I/O on-board capabilities are supported with a PCIe mini-connector supporting industry standard PCI Express Mini Cards
- Two 10/100/1000Base-T Ethernet interfaces available on the SHB's I/O plate
- Six Serial on-board ATA/300 ports support four independent SATA storage devices
  - SATA/300 ports may be configured to support RAID 0, 1, 5 or 10 implementations
- Eight Universal Serial Bus (USB 2.0) interfaces
- Off-board I/O support provided for one 10/100/1000Base-T Ethernet interface and four USB 2.0 port connections on a PICMG 1.3 backplane
- PS/2 mouse and keyboard headers, high-speed RS232 and RS232/422/RS485 serial ports
- An additional x1 PCI Express 2.0 lane is available when using an Trenton IOB33 expansion board on the THD8141 connected to a Trenton PICMG 1.3 backplane with an PCIe Expansion Slot
- An optional media expansion board (MPE40) is available for use with the THD8141. The MPE40 plugs into an expansion connector on the THD8141 SHB to provide support for audio connections and an additional DVD-D video interface. Legacy I/O support and the additional x1 PCIe link to a PICMG 1.3 backplane are also supported on the MPE40.
- A full-length backer plate on the rear of the SHB enhances the rugged nature on the board by maximizing component protection and simplifying mechanical system integration
- Full PC compatibility
- Revision controlled Aptio 4.x BIOS for American Megatrends, Inc. (AMI) resides in the SHB's SPI flash device to simplify field upgrades and BIOS customization
  - See the *[BIOS Setup Manual](#)* for THD8141 System Host Board for more information

**THD8141 (8141-xxx) – Single-Processor SHB Block Diagram shown with MPE40 Media Option**

**THD8141 (8141-xxx) – Single-Processor SHB Layout Diagram – Top**

**THD8141 (8141-xxx) – Single-Processor SHB Layout Diagram – Bottom**

Note: The backer plate has been removed in the view below. Access hole are provide in the plat in order to allow access to the Mini-PCle connector (P10).

**Processor**

- Intel® Xeon® E3-1200 v3 Series Processor – Long-life 22nm/Haswell Workstation processor or the long-life 22nm/Haswell Desktop versions including the Intel® Core™ i7-4790S, Intel® Core™ i5-4590S and Intel® Core™ i3-4330TE processor
- Processor plugs into an LGA1150 socket

**Supported Intel® Processor Technologies**

The Intel® technologies supported on the THD8141 system host board include:

- **Intel® Advanced Management Technology 9.0 (Intel® AMT)** – Provides the ability to monitor, maintain, update, upgrade, and repair a system remotely using one of the SHB’s available Ethernet interfaces. Intel AMT is part of the processor’s Intel Management Engine and the specific processor option selected for the use on the board must support Intel vPro technology in order to take full advantage of Intel AMT 9.0.
- **Intel® vPro** – Intel vPro is a combination of processor technologies, silicon hardware enhancements and management features that enable technologies like Intel AMT 9.0 to function.
- **Intel® Hyper-Threading (Intel® HT)** – This processor technology allows simultaneous multithreading of CPU tasks to enable parallel system operations. An operating system that is hyper-threading aware can address each core as a logical processor in order to spread out execution tasks to improve application software efficiency and overall system speed.
- **Intel Virtualization Technology (Intel® VT-x)** - Enabled in the SHB’s BIOS, this technology enables multiple operating systems to run in specific Sandy Bridge processor cores thereby creating virtual machines (VMs) on a single SHB.
- **Intel Virtualization Technology for Directed I/O (Intel® VT-d)** – This is a sub-set of Intel VT-x and enables I/O device assignments to specific processor cores or VMs. Intel VT-d also supports DMA remapping, interrupt remapping and software DMA and interrupt status reporting. Intel VT-d is an optional extension to the Intel VT-x technology.
- **Intel® VT-x with Extended Page Tables (EPT)** – This feature is enabled in the Haswell micro-architecture to supports the processor’s “real mode” or unrestricted guest feature.
- **Intel Trusted Execution Technology (Intel® TXT)** – This processor feature works in conjunction with the SHB’s on-board Trusted Platform Module or TPM to allow the system designer to create multiple and separated execution environments or partitions with multiple levels of protection and security. The TPM provides for a way to generate and store an encrypted access key for authenticated access to sensitive applications and data. This private key never leaves the TPM, is generally available only to authorized system administrators, and enables remote assurance of a system’s security state.
- **Intel Turbo Boost Technology 2.0** – The higher performance Haswell processors may run above the processors stated clock speed via a new dynamic processor speed control technology called Intel Turbo Boost 2.0. The processor enters the boost mode when the operating system requests the highest possible performance state as defined by the Advanced Configuration and Power Interface or ACPI.
- **Intel® Advanced Encryption Standard New Instructions (Intel® AES-NI)** – Seven new instructions available in the Haswell micro-architecture makes pervasive encryption in an IT environment possible while enabling implementation that is faster and more affordable by providing advanced data protection and greater hardware platform security.

*Note: The Intel® Core™ i3 processor options do not support many of these advanced Intel processor technologies.*

The following chart defines which Intel technology is supported on which particular embedded Haswell processor featured on the THD8141 system host board.

Intel Technology	Intel Xeon E3-1275 v3	Intel Xeon E3-1225 v3	Intel Xeon E3-1268L v3	Intel Core i7-4790S	Intel Core i7-4770S	Intel Core i7-4770 TE	Intel Core i5-4590S	Intel Core i5-4590T	Intel Core i5-4570S	Intel Core i5-4570 TE	Intel Core i3-4330 TE	Intel Core i3-4340 TE	Intel Core i3-4350 TE	Intel Core i3-4330	Intel Core i3-4360

### Serial Interconnect Interface

PCI Express® 3.0, 2.0, and 1.1 compatible

### Data Path

DDR3-1600 Memory - 64-bit (per channel)

### Serial Interconnect Speeds

PCI Express 3.0 – 8.0GHz per lane

PCI Express 2.0 – 5.0GHz per lane

PCI Express 1.1 - 2.5GHz per lane

### Platform Controller Hub (PCH)

- Intel® C226 Platform Controller Hub (Lynx Point)

### Intel® Direct Media Interface (DMI)

The Haswell processors support the latest interface version called DMI. DMI supports communications between the board's processor and Intel® C226 PCH up to 20Gb/s each direction, full duplex and is transparent to software.

### Intel® Flexible Display Interface (FDI) Between CPU and PCH

The FDI interconnect between the processor's display engine and the analog and digital video monitor interfaces connects to the Intel® C226 PCH. The FDI channel features differential signaling supporting 2.7Gb/s video data transfers for both single and dual monitor applications.

### Memory Interface

The THD8141 features two memory channels of unbuffered DDR3 with two DIMMs per channel. These DDR3-1600 memory interface channels support up to four, unbuffered, ECC PC3-12800 standard memory DIMMs. Non-ECC DDR3 DIMMs are also supported, but the two memory types cannot be used together on the SHB. The peak memory interface transfer rate per channel is 1600MT/s when using PC3-12800 DIMMs.

### DMA Channels

The SHB is fully PC compatible with seven DMA channels, each supporting type F transfers.

### Interrupts

The SHB is fully PC compatible with interrupt steering for PCI plug and play compatibility.

**Bios (Flash)**

The THD8141 board uses an Aptio® 4.x BIOS from American Megatrends Inc. (AMI). The BIOS features built-in advanced CMOS setup for system parameters, peripheral management for configuring on-board peripherals and other system parameters. The BIOS resides in a 32Mb Atmel® AT25DF321SU SPI Serial EEPROM (SPI Flash). The BIOS may be upgraded from a USB thumb drive storage device by pressing <Ctrl> + <Home> immediately after reset or power-up with the USB device installed in drive A:. Custom BIOSs are available.

**Cache Memory**

The processors include either a 4MB, 6MB or 8MB Intel® Smart Cache memory capacity that is equally shared between all of the processor cores on the die.

**DDR3-1600 Memory**

The SHB supports two DDR3-1600 memory interface channels that can support two DIMMs each. The four active DIMM sockets on the THD8141 models can support up to 8GB DIMMs for a total possible DDR3 system memory capacity of 32GB. However, the most common DDR3 DIMM memory capacities are 1GB, 2GB and 4GB. The system memory capacity limit when using 4GB DIMMS is 16GB. The peak memory interface transfer rate per channel is 1600MT/s when using PC3-12800 (i.e. DDR3-1600) DIMMs.

The System BIOS automatically detects memory type, size and speed. Trenton recommends unbuffered ECC PC3-12800 or PC3-10600 DDR3 memory modules for use on the THD8141. These unbuffered ECC registered (64-bit) DDR3 DIMMs must be PC3-12800 or PC3-10600 compliant. Unbuffered non-ECC DDR3 DIMMs are also supported on the THD8141 SHB, but you cannot mix the two different memory types on the same board.

**NOTES:**

- To maximize memory interface speed, populate each memory channel with DDR3 DIMMs having the same interface speed. The SHB will support DIMMs with different speeds, but the memory channel interface will operate speed of the slowest DIMM.
- All memory modules must have gold contacts.
- All memory modules must have a 240-pin edge connector
- The SHB supports the following memory module memory latency timings:
  - 9-9-9 for 1333MHz DDR3 DIMMs
  - 11-11-11 for 1600MHz DDR3 DIMMs
- Populate the memory sockets starting with memory channel A and begin by using the DIMM socket closest to the CPU first. Refer to the THD8141 board layout drawing and populate the memory sockets using the population order illustrated in the chart below:

Population order <sup>#</sup>	CPU1
1	BK0A
2	BK1A
3	BK0B
4	BK1B

<sup>#</sup>Using a balanced memory population approach ensures maximum memory interface performance. A “balance approach” means using an equal number of DIMMs on the THD8141 SHB whenever possible.

The memory DIMMs on the SHB connect directly to the CPU and at least one memory module must be installed on the board.

**Universal Serial Bus (USB)**

The SHB supports a total of ten USB interfaces. USB ports 0 and 1 are located on the I/O bracket and support USB 3.0 & 2.0 devices as does on-board header P6 that supports USB ports 4 & 5. On-board header ports 2 and 3, and backplane interface ports 8, 9, 10, and 11; routed to the SHB's edge connector C, support USB 2.0 devices.

**Analog Video Interface**

The processor's integrated graphics controller dynamically utilizes a portion of the system memory based on the OS and the amount of memory installed. The Intel Xeon E3-1200 v3 series features Intel HD Graphics P4600 while the Intel Core™ processors offer Intel HD Graphics 4600. Both processor types support maximum video resolutions of 2560 x 1600. Independent VGA and DVI interfaces are available directly on the board with the VGA port on the SHB's I/O bracket and the on-board DVI-D connector. The SHB's VGA monitor port connects to the Intel® C226 PCH and video data is routed to the processor via the Intel® Flexible Display Interface.

**Digital Video Interface**

A DVI-D monitor port connects directly to the processor via the DVI interface port on the CPU. Both of the on-board VGA and DVI-D display ports may be used simultaneously.

**MPE40 Overview**

The optional Trenton MPE40 card may also be used with the THD8141 SHB to provide an additional PCIe link to a backplane equipped with a PCI Express expansion slot. The Trenton BPG7087 and BPG6600 are two backplane that feature this PCI Express expansion slot. The IOB33 routes an additional PCIe x1 link available from the THD8141's PCH via an on-board PCI Express switch down to a backplane for use in PCI Express link and/or bandwidth expansion. This additional link may operate at the PCIe 2.0 or PCIe 1.1 link interface speed depending on the backplane and end-point configuration.

The MPE40 board plugs into connectors P20A and P20B on the THD8141 to provide PCIe link expansion to a compatible PICMG 1.3 backplane, legacy I/O and audio interface support, as well as system support for additional DVI-D video interface.

**MPE40 Media Expansion Board – Additional DVI-D Video Interface**

Haswell processors feature additional video interfaces, but the required connectors could not be accommodated in the THD8141 design due to SHB size limitations. However, an additional DVI-D video interface can be supported on the THD8141 by using the optional MPE40 card. The MPE40 is a mezzanine board that plugs into the SHB's P20A and P20B controlled impedance connectors to provide an additional DVI-D Port video connection at the rear of the system chassis. All THD8141 video interfaces are made possible by use of the optional MPE40 may be used simultaneously.

**MPE40 Media Expansion Board – Audio Port Interfaces**

The Intel® C226 PCH supports an audio CODEC connection. The MPE40 utilizes a Hi-Def audio CODEC ALC262D to decode these audio signals. The MPE40 mezzanine board plugs into the SHB's two high impedance connectors (P20A and P20B) to provide LINE In and LINE Out connections at the rear of the system chassis as well as an AC97 HD audio header connection.

**IOB33 Overview**

The IOB33 is optional I/O expansion board that may be used on the THD8141 SHB for the purpose of routing an additional x1 PCIe expansion link from the THD8141's PCH down to the PCIe Expansion Slot on a Trenton backplane. The IOB33 plugs into the THD8141's P20A controlled impedance connector and also provides legacy I/O interface support to the system designer.

### PCI Express Interfaces

PCI Express® links A0, A2 and A3 on the THD8141 directly connect PCI Express 3.0 links from the SHB's Haswell processor to a PICMG 1.3 backplane via the boards PCIe Gen3 link retimers. PCIe 3.0 retimers maximize signal integrity regardless of where an end-point device is located on a PICMG 1.3 backplane. These PCIe links can operate as either PCI Express 3.0, 2.0, or 1.1 links based on the end-point devices on the backplane that are connected to the SHB. The multiple PCIe links from the processor can be combined into a single x16 PCIe electrical link or a combination of one x8 (A0), and two x4 links (A2 and A3) on a backplane. The processor's PCIe links may train down to x1 links, but cannot bifurcate into multiple x1 links. The PCIe link (B0) is a PCIe 2.0 interface and comes from the board's PCH. Link B0 has a x4 default configuration and can automatically bifurcate into four, x1 PCIe links. A x1 PCIe 2.0 expansion link is also available for board configurations that utilize either a IOB33 or MPE40 optional plug-in I/O or Media expansion module. A system design must include a PICMG 1.3 backplane with a PCIe expansion slot in order to take advantage of this additional x1 PCIe link. Refer to the *PCI Express® Reference* chapter and to *Appendix C - PCI Express Backplane Usage* of this manual for more information.

### Serial ATA (SATA) Ports

The six Serial ATA (SATA) ports on the SHB are driven with a built-in SATA controller from the Intel® C226 Platform Controller Hub (PCH). All of the board's SATA interfaces comply with the SATA 1.0, SATA 2.0, and SATA 3.0 specifications that define support for data transfer rates of 150MB/s, 300 MB/s, and 600MB/s respectively depending on the SATA device type connected.

The SHB's SATA controller may support up to six independent SATA storage devices such as hard disks and CD-RW devices. The SATA controller has two BIOS selectable modes of operation with a legacy (i.e. IDE) mode using I/O space, and an AHCI mode using memory space. Software that uses legacy mode will not have AHCI capabilities.

### Serial ATA (SATA) Ports (continued)

The board's PCH features support for Intel® Rapid Storage Technology (Intel® RST). This feature allows a third BIOS-selectable SATA controller configuration that enables a six drive RAID configuration capable of supporting RAID 0, 1, 5 and 10 storage array implementations.

### SATA RAID Operation (Windows O/S Setup)

The Intel® C226 Platform Controller Hub (PCH) used on the SHB features Intel® Rapid Storage Technology (Intel® RST) and requires a several unique drivers. A [zip file](#) is available on the Trenton Systems website to help you configure the SATA ports as RAID drives connected to the THD8141 while taking advantage of the PCH's drive array management.

The [Microsoft Windows .NET Framework 3.0](#) software framework includes libraries and other useful tools that allow the RST Rapid Storage Manager to install and function properly in reporting drive failure alerts correctly. Windows .NET Framework 3.0 or later may be required to support the latest revisions of the RST Rapid Storage Manager. Windows .NET Framework is already included with Windows 7 or Windows 2008 O/S installations but it does need to be enabled.

If you would like your system to immediately inform you of a failed drive in the RAID array then the "Hot Plug" setting on the Advanced/SATA THD8141 BIOS screen needs to be ENABLED for each drive in the array. If this BIOS setting is DISABLED a drive failure notification alert may take several minutes or even longer if there is no hard drive activity on the RAID array.

## Ethernet Interfaces

The THD8141 supports three Ethernet interfaces. The first two interfaces are on-board 10/100/1000Base-T Ethernet interfaces located on the board's I/O bracket and implemented using an Intel® i350-AM2 Dual Gigabit Ethernet Controller. These I/O bracket interfaces support Gigabit, 100Base-T and 10Base-TX Fast Ethernet modes and are compliant with the IEEE 802.3 Specification.

The main components of the I/O bracket Ethernet interfaces are:

- Intel® i350-AM2 for 10/100/1000-Mb/s media access control (MAC) with SYM, a serial ROM port and a PCIe interface
- Serial ROM for storing the Ethernet address and the interface configuration and control data
- Integrated RJ-45/Magnetics module connectors on the SHB's I/O bracket for direct connection to the network. The connectors require category 5 (CAT5) unshielded twisted-pair (UTP) 2-pair cables for a 100-Mb/s network connection or category3 (CAT3) or higher UTP 2-pair cables for a 10-Mb/s network connection. Category 5e (CAT5e) or higher UTP 2-pair cables are recommended for a 1000-Mb/s (Gigabit) network connection.
- Link status and activity LEDs on the I/O bracket for status indication (See *Ethernet LEDs and Connectors* later in this chapter.)

The third LAN is supported by the Intel® C226 and the Intel® i217-LM Gigabit Ethernet PHY. This 10/100/1000Base-T Ethernet interface is routed to the PICMG 1.3 backplane via SHB edge connector C. The SHB includes an Ethernet connector (P18) that can be utilized to route this interface over an Ethernet cable rather than to the PICMG 1.3 backplane. This interface may be useful in Intel® AMT 7.0 system implementations.

Software drivers are supplied for most popular operating systems.

## Watchdog Timer (WDT)

The THD8141 provides a programmable watchdog timer with programmable timeout periods of 100 msec to 3 minutes via board component U11. When enabled the WDT (i.e. U11) will generate a system reset. WDT control is supplied via the General Purpose IO pins from the Intel® C226 Platform Controller Hub (PCH). The PCH's GPIO\_LVL2 register controls the state of each GPIO signal. This 32-bit register is located within GPIO IO spaces. The GPIO\_BASE IO address is determined by the values programmed into the PCH's LPC Bridge PCI configuration at offset 48-4B(h).

### GPIO Bit Definitions:

#### Watchdog Timer Enable (WDT\_EN#)

Watchdog timer enable/disable functionality is controlled by GPIO32. Clearing bit 0 of the GP\_LVL register enables the WDT. The GP\_LVL2 register is located at IO address GPIO\_BASE + offset 38(h). The power-on default for this bit is a "1" which disables WDT functionality. Setting this bit to a "0" enables the WDT at the pre-selected interval.

#### Watchdog Select 0 (WDT\_S0)

The state of this bit in conjunction with Watchdog Select 0 will select the WDT time out period. This function is controlled by GPIO33 and the state of this bit is determined by bit 1 of the GP\_LVL2 register at IO address GPIO\_BASE + offset 38(h). After POST, the inverted state of this bit is reflected on Port80, LED0. If this bit is set to a "1" the LED is off, if set to a "0" the LED is on. The state of the GPIO pin is inverted at the Select 0 input of U11. See the Watchdog Timeout Period Selection table below for WDT interval selection information.

#### Watchdog Select 1 (WDT\_S1)

The state of this bit in conjunction with Watchdog Select 1 will select the WDT time out period. This function is controlled by GPIO34 and the state of this bit is determined by bit three of the GP\_LVL2 register at IO address GPIO\_BASE + offset 38(h). After POST, the inverted state of this bit is reflected on Port80, LED1. If this bit is set to a "1" the LED in off, if set to a "0" the

LED is on. The state of the GPIO pin is inverted at the Select 0 input of U11. See the Watchdog Timeout Period Selection table below for WDT interval selection information.

#### Watchdog\_ Input (WDT\_IN)

When the WDT is enabled this bit must be toggled (0 -> 1 or 1->0) within the selected watchdog timeout period, failure to do so will result in a system reset. This function is supported by the GPIO71 bit and its state is controlled by bit 23 of the GP\_LVL3 register which is at IO address GPIO\_BASE + offset 48(h). The inverted state of this bit is reflected on Port80, LED7. If this bit is set to a “1” the LED is off, if set to a “0” the LED is on.

#### Watchdog Timeout Period Selections:

WDT_EN# (GPIO32)	WD_S1 (GPIO34)	WD_S0 (GPIO33)	Watchdog Timeout Period
1	X	X	Disabled
0	1	1	100msec
0	1	0	1 sec
0	0	1	10 sec
0	0	0	1 min

The Watchdog Timer may require initialization prior to usage. GPIO 32, 33, 34 and 71 must be configured as outputs. While these GPIOs do default to outputs at power-on, care should be taken to insure they have not been altered prior to WDT usage. These GPIO are configured to outputs by clearing bits 0, 1 and 2 of the GP\_IO\_SEL2 register at GPIO\_BASE + offset 34(h) to a “0”, as well as clearing bit 7 of the GP\_IO\_SEL3 register at GPIO\_BASE + offset 44(h) to a “0”.

After initialization is completed (if required) the Watchdog timer period is selected by via the WDT\_S1 and WDT\_S0 bits. Once the timeout period has been programmed the WDT is “enabled” by clearing the WDT\_EN# bit. To avoid the WDT from generating a system reset the WDT\_IN bit must be toggled within the timeout period.

Programming Example: Enable WDT with 10-second timeout period

**Note:** When writing to any of the WDT controlling GPIO bit the remaining bits of the selected GP\_LVL2 and GP\_LVL3 registers should remain unchanged.

Write bit 0 of GP_LVL2 to 1	pre condition GPIO32 for WDT disable
Write bits 2,1 of GP_LVL2 to 0,1	set Watchdog timeout period to 10 sec
Write bit 0 of GP_LVL2 to 0	enable Watchdog timer

At this point, the bit 7 of GP\_LVL3 (GPIO71) must be toggled within a 10 sec period or the WDT will expire resulting in a system reset.

**Power Requirements**

The following power requirements table reflects nominal lab test values that were produced when 16GB of system memory were installed in the board installed.

Processor Type	SHB Type	Processor Speed	+5V	+12V	+3.3V
<b>CPU Idle State:</b>					
Intel Xeon E3-1275 v3	THD8141	3.5GHz	0.55A	1.15A	2.63A
Intel Xeon E3-1225 v3	THD8141	3.2GHz	0.48A	1.11A	2.62A
Intel Xeon E3-1268L v3	THD8141	2.3GHz	0.47A	1.16A	2.61A
Intel Core i7-4790S	THD8141	3.2GHz	0.47A	1.11A	2.64A
Intel Core i5-4590S	THD8141	3.0GHz	0.48A	1.13A	2.66A
Intel Core i3-4330TE <sup>D</sup>	THD8141	2.4GHz	0.47A	1.37A	2.66A
<b>100% CPU Stress State:</b>					
Intel Xeon E3-1275 v3	THD8141	3.5GHz	0.66A	7.39A	3.07A
Intel Xeon E3-1225 v3	THD8141	3.2GHz	0.62A	6.13A	3.10A
Intel Xeon E3-1268L v3	THD8141	2.3GHz	0.59A	4.57A	3.08A
Intel Core i7-4790S	THD8141	3.2GHz	0.57A	6.37A	3.11A
Intel Core i5-4590S	THD8141	3.0GHz	0.59A	4.84A	3.11A
Intel Core i3-4330TE <sup>D</sup>	THD8141	2.4GHz	0.58A	2.76A	3.09A

Tolerance for all voltages is +/- 5%

<sup>D</sup>Dual-core processor, all other processors are quad-core CPUs

Actual power number will vary as a function on the system application.

**CAUTION:** Trenton recommends an EPS type of power supply for systems using high-performance processors. The power needs of backplane option cards, high-performance processors and other system components may result in drawing 20A of current from the +12V power supply line. If this occurs, hazardous energy (240VA) could exist inside the system chassis. Final system/equipment suppliers must provide protection to service personnel from these potentially hazardous energy levels.

Stand-by voltages may be used in the final system design to enable certain system recovery operations. In this case, the power supply may not completely remove power to the system host board when the power switch is turned off. Caution must be taken to ensure that incoming system power is completely disconnected before removing the system host board.

### Power Fail Detection

A hardware reset is issued when any of the voltages being monitored drops below its specified nominal low voltage limit. The monitored voltages and their nominal low limits are listed below.

<u>Monitored Voltage</u>	<u>Nominal Low Limit</u>	<u>Voltage Source</u>
+5V	4.75 volts	System Power Supply
+3.3V	2.97 volts	System Power Supply
Vcc_DDR(+1.5V)	1.15 volts	On-Board Regulator
VCCIO_CPU(1.05V)	0.70 volt	On-Board Regulator
+1.05V(Chipset)	0.924 volt	On-Board Regulator
+1.05V(Chipset-ME)	0.924 volt	On-Board Regulator

### Battery

A built-in lithium battery is provided for ten years of data retention for CMOS memory.

---

**CAUTION:** There is a danger of explosion if the battery is incorrectly replaced. Replace it only with the same or equivalent type recommended by the battery manufacturer. Dispose of used batteries according to the battery manufacturer's instructions.

---

### Temperature/Environment

**Operating Temperature:** 0° C. to 50° C. for all CPU options except the E3-1275 v3 processor. Maximum THD8141 operating temperature when using the Intel® Xeon® E3-1275 v3 processor is 45° C.

**Air Flow Requirement:** 350LFM continuous airflow

**Storage Temperature:** - 40° C. to 70° C.

**Humidity:** 5% to 90% non-condensing

### Mechanical

The standard cooling solution used on the THD8141 enables placement of option cards approximately 2.15" (54.61mm) away from the top component side of the SHB. Contact Trenton for a system engineering consultation if your application needs a lower profile cooling solution. The SHB's overall dimensions are 13.330" (33.858cm) L x 4.976" (12.639cm) H. The relative PICMG 1.3 SHB height off the backplane is the same as a PICMG 1.0 SBC due to the shorter PCI Express backplane connectors.

### Board Stiffener Bars / Full-Length Backer Plate

The THD8141 boards' full-length backer plate ensures the safe insertion and removal of the SHB from any system by ensuring proper SHB alignment within the card guides of a computer chassis. This rugged backer plate design maximizes system reliability by shielding the SHB's rear-mounted components from mechanical damage.

### Mean Time Between Failures (MTBF)

234,190 Power-On Hours (POH) at 40° C per Bellcore

### Industry Certifications

This SHB is designed to meet a variety of internationally recognized industry standards including UL60950, CAN/CSA C22.2 No. 60950-00, EN55022:1998 Class B, EN61000-4-2:1995, EN61000-4-3:1997, EN61000-4-4:1995, EN61000-4-5:1995, EN61000-4-6:1996 and EN61000-4-11:1994.

### Configuration Jumpers

The setup of the configuration jumpers on the SHB is described below. An asterisk (\*) indicates the default value of each jumper.

**NOTE:** For the three-position JU12 jumper, "RIGHT" is toward the I/O bracket side of the board; "LEFT" is toward the header connector P14.

#### JU1 SPI Update (two position jumper)

Install for one power-up cycle to enable the board to unprotect the SHB's SPI storage device. Remove for normal operation. \*

---

**CAUTION:** Installing this jumper is only done for special board operations such as changing the PCI Express link bifurcation operation. Contact Trenton tech support *before* installing this jumper to prevent any unintended system operation.

---

#### JU2 Serial Port 1 Interface Configuration

JU2 uses five jumpers to allow serial port one to be configured as either a RS232 or a RS422/RS485 electrical interface. The jumper tables below illustrate the possible interface configurations for serial port one.

RS232 operation\* – Jumper 1 to 2 and 3 to 4 and 9 to 10  
 RS485 Full Duplex, No Termination – Jumper 1 to 2 and 9 to 10<sup>1</sup>  
 RS485 Half Duplex, No Termination – Jumper 9 to 10  
 RS485 Full Duplex, With Termination – Jumper 1 to 2 and 5 to 6<sup>2</sup>  
 RS485 Half Duplex, With Termination – Jumper 5 to 6 and 9 to 10

**Notes:**

1 – Shut between pins 9 and 10 can optionally be removed to unconditionally enable the Tx driver  
 2 – Shut between pins 9 and 10 can optionally be installed to unconditionally enable the Tx driver

#### JU3 Clear Management Engine (ME) Operational Parameters (two position jumper)

The board's management engine has its own CMOS Non-Volatile Memory (NVM) that stores operational parameters for Intel AMT 9.0 implementations.

Install for one power-up cycle to clear management engine CMOS settings. Remove for normal operation. \*

#### JU8 Password Clear (two position jumper)

Install for one power-up cycle to reset the password to the default (null password). Remove for normal operation. \*

#### JU12 CMOS Clear (three position jumper)

Install on the LEFT to clear.  
 Install on the RIGHT to operate. \*

**NOTE:** To clear the CMOS, power down the system and install the JU12 jumper on the LEFT. Wait for at least two seconds, move the jumper back to the RIGHT and turn the power on. Clearing CMOS on the THD8141 will not result in a checksum error on the following boot. If you want to change a BIOS setting, you must press DEL or the F2 key during POST to enter BIOS setup after clearing CMOS.

## Status LEDs

### P4A/P4B Ethernet LEDs and Connectors

The I/O bracket houses the two RJ-45 network connectors for Ethernet LAN1 and LAN2. Each LAN interface connector has two LEDs that indicate activity status and Ethernet connection speed. Listed below are the possible LED conditions and status indications for each LAN connector:

<b><u>LED/Connector</u></b>	<b><u>Description</u></b>
Activity LED	Green LED that indicates network activity. This is the upper LED on the LAN connector (i.e., toward the upper memory sockets).
Off	Indicates there is no current network transmit or receive activity.
On (flashing)	Indicates network transmit or receive activity.
Speed LED	This multi-color LED identifies the connection speed of the SHB's P4A (LAN2) and P4B (LAN1) Ethernet interfaces. These are the lower LEDs on the dual LAN connector (i.e., toward the edge connectors).
Green	Indicates a valid link at 1000-Mb/s or 1Gb/s.
Orange	Indicates a valid link at 100-Mb/s.
Off	Indicates a valid link at 10-Mb/s.
RJ-45 Network Connector	The RJ-45 network connector requires a category 5 (CAT5) unshielded twisted-pair (UTP) 2-pair cable for a 100-Mb/s network connection or a category 3 (CAT3) or higher UTP 2-pair cable for a 10-Mb/s network connection. A category 5e (CAT5e) or higher UTP 2-pair cable is recommended for a 1000-Mb/s (Gigabit) network connection

### **Backplane LAN LED – LED8** (Labeled LED2 on Rev0 boards)

LED8 is located just above the right side of memory DIMM connector BK1B. A flashing LED8 indicates that network transmit and receive activity is occurring on the Ethernet LAN routed to the board's edge connector C / cable connector P18. This LAN provides a network interface for use on a compatible PICMG 1.3 backplane or over a cable.

**Status LEDs (continued)****Thermal Trip LED – LED9** (Labeled LED11 on Rev0 boards)

The thermal trip LED indicates when a processor reaches a shut down state. The LED is located just above the SATA connector P28. LED9 indicates the processor shutdown status and thermal conditions as illustrated below:

<b><u>LED Status</u></b>	<b><u>Description</u></b>
Off	Indicates the processor is operating within acceptable thermal levels
On (flashing)	Indicates the CPU is throttling down to a lower operating speed due to rising CPU temperature
On (solid)	Indicates the CPU has reached the thermal shutdown threshold limit. The SHB may or may not be operating, but a thermal shutdown may soon occur.

---

**NOTE:** When a thermal shutdown occurs, the LED will stay on in systems using non- ATX/EPS power supplies. The CPU will cease functioning, but power will still be applied to the SHB. In systems with ATX/EPS power supplies, the LED will turn off when a thermal shutdown occurs because system power is removed via the ACPI soft control power signal S5. In this case, all SHB LEDs will turn off; however, stand-by power will still be present.

---

**PCIe Mini Card WLAN LED – LED10** (Labeled LED1 on REV0 boards)

When LED10, located just to the right of LED9, is flashing this indicates that network transmit and receive activity is occurring on an Ethernet LAN that is located on an optional PCIe Mini Card connected to the THD8141's Mini PCIe Expansion connector P10. P10 is located on the bottom side of the SHB.

**VRM LED – LED11** (Labeled LED12 on Rev0 boards)

LED11 is a red LED located just above the left side of memory DIMM connector BK1B. If LED11 were to turn on and remain on, this would indicate that the voltage levels of the SHB's VRM circuits are not within the acceptable operating range. In all likelihood the SHB will fail to function if LED11 is on and the source of the voltage error could reside in the system power supply, the power supply wiring or on the board itself. Contact your system integrator or Trenton Tech Support for trouble shooting assistance.

**POST Code LEDs 0 - 7** (Labeled LEDs 1-8 on Rev0 boards)

As the POST, (Power On Self Test) routines are performed during boot-up; test codes are displayed on Port 80 POST code LEDs 0, 1, 2, 3, 4, 5, 6 and 7. These LED are located on the top of the SHB, just above the board's SATA connectors and slightly toward the right. The POST Code LEDs and are numbered from right (position 1 = LED0) to left (position 8 – LED7). Refer to the board layout diagram for the exact location of the POST code LEDs.

These POST codes may be helpful as a diagnostic tool. After a normal POST sequence the LEDs are off (00h) indicating that the SHB's BIOS has passed control over to the operating system loader typically at interrupt INT19h. Specific test codes and their meaning along with the following chart are listed in Appendix A and can be used to interpret the LEDs into hexadecimal format during POST.

Upper Nibble (UN)				
Hex. Value	LED7	LED6	LED5	LED4
0	Off	Off	Off	Off
1	Off	Off	Off	On
2	Off	Off	On	Off

## System BIOS Setup Utility

The THD8141 features the Aptio® 4.x BIOS from American Megatrends, Inc. (AMI) with a ROM-resident setup utility called the Aptio Text Setup Environment or TSE. The TSE setup utility allows you to select to the following categories of options:

- Main Menu
- Advanced Setup
- Boot Setup
- Security Setup
- Chipset Setup
- Exit

Each of these options allows you to review and/or change various setup features of your system. Details of the Aptio TSE are provided in the separate *THD8141BIOS Technical Reference* manual. The BIOS and hardware technical reference manuals are available under the **Downloads** tab on the [THD8141](#) web page.

---

**Connectors**

---

**NOTE:** Pin 1 on the connectors is indicated by the square pad on the PCB.

---

- P1** - **Analog Video Interface Connector**  
15 position socket connector, Amp/TYCO 1-1734530-3

<u>Pin</u>	<u>Signal</u>	<u>Pin</u>	<u>Signal</u>	<u>Pin</u>	<u>Signal</u>
1	Red	6	GND	11	NC
2	Green	7	GND	12	EEDI
3	Blue	8	GND	13	HSYNC
4	NC	9	+5	14	VSYNC
5	GND	10	GND	15	EECS

Note: Video connector supports standard DB15 analog video cables

- P2** - **Reset Connector**  
2 pin single row header, Amp #640456-2

<u>Pin</u>	<u>Signal</u>	<u>Pin</u>	<u>Signal</u>
1	GND	2	Reset In

- P3** - **CPU Fan Power Connector**  
3 pin single row header, Molex #22-23-2031

<u>Pin</u>	<u>Signal</u>
1	GND
2	+12V
3	FanTach

- P4A, P4B** - **10/100/1000Base-T Ethernet Connectors - LAN1/LAN2**  
Dual RJ-45 connector, Pulse #JG0-0024NL

Each individual RJ-45 connector is defined as follows:

<u>Pin</u>	<u>Signal</u>	<u>Pin</u>	<u>Signal</u>
1A	L2_MDI0n	1B	L1_MDI0n
2A	L2_MDI0p	2B	L1_MDI0p
3A	L2_MDI1n	3B	L1_MDI1n
4A	L2_MDI1p	4B	L1_MDI1p
5A	L2_MDI2n	5B	L1_MDI2n
6A	L2_MDI2p	6B	L1_MDI2p
7A	L2_MDI3n	7B	L1_MDI3n
8A	L2_MDI3p	8B	L1_MDI3p
9A	VCC_1.8V	9B	VCC_1.8V
10A	GND_A	10B	GND_b

Notes:

- 1 - LAN ports support standard CAT5 Ethernet cables
- 2 - P4A is LAN2 and P4B is LAN1

8	A_MDI0P

**BP LAN Cable Option**

You may elect to create your own backplane LAN cable using the mating Molex connector information below. However, Trenton does offer a pre-made alternate backplane LAN cable with the mating Molex connector on one end and an RJ45 connector mounted into an I/O bracket on the other end. The Trenton part number for the alternate backplane LAN cable is:

**193500001150-00.**

*Note: Using the alternate backplane LAN cable effectively disconnects the LAN routing down to SHB edge connector C.*

## Chapter 2 PCI Express® Reference

### Introduction

PCI Express® is a high-speed, high-bandwidth interface with multiple channels (lanes) bundled together with each lane using full-duplex, serial data transfers with high clock frequencies.

The PCI Express architecture is based on the conventional PCI addressing model, but improves upon it by providing a high-performance physical interface and enhanced capabilities. Whereas the PCI bus architecture provided parallel communication between a processor board and backplane, the PCI Express protocol provides high-speed serial data transfer, which allows for higher clock speeds. The same data rate is available in both directions simultaneously, effectively reducing bottlenecks between the system host board (SHB) and PCI Express option cards.

PCI Express option cards may require updated device drivers. Most operating systems that support legacy PCI cards will also support PCI Express cards without modification. Because of this design, PCI, PCI-X and PCI Express option cards can co-exist in the same system.

PCI Express connectors have lower pin counts than PCI bus connectors. The PCIe connectors are physically different, based on the number of lanes in the connector.

### PCI Express Links

Several PCI Express channels (lanes) can be bundled for each expansion slot, leaving room for stages of expansion. A link is a collection of one or more PCIe lanes. A basic full-duplex link consists of two dedicated lanes for receiving data and two dedicated lanes for transmitting data. PCI Express supports scalable link widths in 1-, 4-, 8- and 16-lane configurations, generally referred to as x1, x4, x8 and x16 slots. A x1 slot indicates that the slot has one PCIe lane, which gives it a bandwidth of 250MB/s in each direction. Since devices do not compete for bandwidth, the effective bandwidth for each version of PCI Express listed below ranges from 500MB/s up to 2GB/s (full-duplex).

The number and configuration of an SHB's PCI Express links is determined by specific component PCI Express specifications. In PCI Express Gen1.1 the bandwidths for the PCIe links are determined by the link width multiplied by 250MB/s and 500MB/s, as follows:

Slot		Full-Duplex
<u>Size</u>	<u>Bandwidth</u>	<u>Bandwidth</u>
x1	250MB/s	500MB/s
x4	1GB/s	2GB/s
x8	2GB/s	4GB/s
x16	4GB/s	8GB/s

In PCIe Gen2 the bandwidths for the PCIe links are doubled as compared to PCIe Gen1.1 as shown below:

Slot		Full-Duplex
<u>Size</u>	<u>Bandwidth</u>	<u>Bandwidth</u>
x1	500MB/s	1GB/s
x4	2GB/s	4GB/s
x8	4GB/s	8GB/s
x16	8GB/s	16GB/s

Link protocol changes and speed increases double PCIe Gen3 bandwidths compared to PCIe Gen2 speeds:

Slot		Full-Duplex
<u>Size</u>	<u>Bandwidth</u>	<u>Bandwidth</u>
x1	1GB/s	2GB/s
x4	4GB/s	8GB/s
x8	8GB/s	16GB/s
x16	16GB/s	32GB/s

Scalability is a core feature of PCI Express. Some chipsets allow a PCI Express link to be subdivided into additional links, e.g., a x8 link may be able to be divided into two x4 links. In addition, although a board with a higher number of lanes will not function in a slot with a lower number of lanes (e.g., a x16 board in a x1 slot) because the connectors are mechanically and electrically incompatible, the reverse configuration will function. A board with a lower number of lanes can be placed into a slot with a higher number of lanes (e.g., a x4 board into a x16 slot). The link auto-negotiates between the PCI Express devices to establish communication. The mechanical option card slots on a PICMG 1.3 backplane must have PCI Express configuration straps that alert the SHB to the PCI Express electrical configuration expected. The SHB can then reconfigure the PCIe links for optimum system performance.

For more information, refer to the PCI Industrial Manufacturers Group's *SHB Express® System Host Board PCI Express Specification, PICMG®1.3*.

### **SHB Configuration**

The THD8141 is a combo class SHB designed to support either PCI Express server-class or graphics-class backplane configurations. Server applications require multiple, high-bandwidth PCIe links, and therefore the server-class SHB/backplane configuration is identified by multiple x8 and x4 links to the SHB edge connectors.

SHBs, which require high-end video or graphics cards generally, use a x16 PCI Express link. The graphics-class SHB/backplane configuration is identified by one x16 PCIe link and one x4 or four x1 links to the edge connectors. Previous generation PCIe video or graphics cards communicated to the SHB at an effective x1, x4 or x8 PCI Express data rate over the card's x16 PCIe mechanical connector and did not actually make use of all of the signal lanes in a x16 connector. The latest video and graphics cards make full use of the available x16 bandwidth by communicating to the SHB at the x16 PCIe data rate. An example of such a high-end x16 card is the [Matrox Mura™ MPX](#) video controller board

---

**NOTE:** The THD8141 eliminates the PICMG 1.3 requirement that server-class SHBs should always be used with server-class PICMG 1.3 backplanes and graphics-class SHBs should always be used with graphics-class PICMG 1.3 backplanes. This is because of the PCIe links integrated into the THD8141 processor, and the SHB architecture itself that can sense the backplane end-point devices and configure the SHB links for either server or graphics-class operations. For this reason, the Trenton THD8141 is referred to as a combo-class SHB.

---

**PCI Express Edge Connector Pin Assignments**

Trenton’s THD8141 SHB uses edge connectors A, B, C and D. Optional I/O signals are defined in the PICMG 1.3 specification and if implemented must be located on edge connector C of the SHB. The SHB makes the Intelligent Platform Management Bus (IPMB) signals available to the user. The SHB supports four USB ports (USB 4, 5, 6 and 7) and one 10/100/1000Base-T Ethernet interface on PICMG 1.3 compatible backplanes via the SHB’s edge connector C. Connector D offers a 32-bit/33MHz parallel interface for backplanes that provide the PICMG 1.3 optional D connector.

The following table shows pin assignments for the PCI Express edge connectors on the THD8141 SHB.

\* Pins 3 and 4 of Side B of Connector A (TDI and TDO) are jumpered together.

Connector A		Connector B		Connector C		Connector D					
Side B	Side A	Side B	Side A	Side B	Side A	Side B	Side A				
1	SMCLK	SMBDAT	1	+5VSBY	+5VSBY	1	USBP0+	GND	1	INTB#	INTA#

### Optional IOB33 PCI Express Link Expansion

An optional Trenton IOB33 module may be used with the THD8141 SHB to provide an additional PCIe link to a backplane equipped with a PCI Express expansion slot. The Trenton BPG7087 and BPG6600 backplane feature this PCI Express expansion slot. The IOB33 routes an additional PCIe x1 link available from the THD8141's PCH via an on-board PCI Express switch down to a backplane for use in PCI Express link and/or bandwidth expansion. This additional link may operate at the PCIe 1.1 or PCIe 2.0 interface speed depending on the backplane and end-point configuration.

The IOB33board plugs into connector P20A on the THD8141.

**Optional MPE40 Media and PCI Express Link Expansion**

The optional Trenton MPE40 module may also be used with the THD8141 SHB to provide an additional PCIe link to a backplane equipped with a PCI Express expansion slot. The Trenton BPG7087 and BPG6600 backplane feature this PCI Express expansion slot. The IOB33 routes an additional PCIe x1 link available from the THD8141's PCH via an on-board PCI Express switch down to a backplane for use in PCI Express link and/or bandwidth expansion. This additional link may operate at the PCIe 1.1 or PCIe 2.0 interface speed depending on the backplane and end-point configuration.

The MPE40 board plugs into connectors P20A and P20B on the THD8141 and also provides additional I/O, DVI-D and audio interfaces.

Either an IOB33 **or** an MPE40 module can connect to a THD8141. These optional modules cannot be used simultaneously on a single THD8141 system host board.

## Chapter 3 THD8141 System Power Connections

### Introduction

To improve system MTTR (Mean Time To Repair), the PICMG 1.3 specification defines enough power connections to the SHB's edge connectors to eliminate the need to connect auxiliary power to the SHB. All power connections in a PICMG 1.3 system can be made to the PICMG 1.3 backplane. This is true for SHBs that use high-performance processors. The connectors on a backplane must have an adequate number of contacts that are sufficiently rated to safely deliver the necessary power to drive these high-performance SHBs. Trenton's PICMG 1.3 backplanes define ATX/EPS and +12V connectors that are compatible with ATX/EPS power supply cable harnesses and provide multiple pins capable of delivering the current necessary to power high-performance processors.

The PICMG® 1.3 specification supports soft power control signals via the Advanced Configuration and Power Interface (ACPI). Trenton SHBs support these signals, which are controlled by the ACPI and are used to implement various sleep modes. Refer to the General ACPI Configuration section of the *Advanced Setup* chapter in this manual for information on ACPI BIOS settings.

When soft control signals are implemented, the type of ATX or EPS power supply used in the system and the operating system software will dictate how system power should be connected to the SHB. It is critical that the correct method be used.

### Power Supply and SHB Interaction

The following diagram illustrates the interaction between the power supply and the processor. The signals shown are PWRGD (Power Good), PSON# (Power Supply On), 5VSB (5 Volt Standby) and PWRBT# (Power Button). The +/- 12V, +/-5V, +3.3V and Ground signals are not shown.

PWRGD, PSON# and 5VSB are usually connected directly from an ATX or EPS power supply to the backplane. The PWRBT# is a normally open momentary switch that can be wired directly to a power button on the chassis.

**CAUTION:** In some ATX/EPS systems, the power may appear to be off while the 5VSB signal is still present and supplying power to the SHB, option cards and other system components. The +5VAUX LED on a Trenton PICMG 1.3 backplane monitors the 5VSB power signal; “green” indicates that the 5VSB signal is present. Trenton backplane LEDs monitor all DC power signals, and all of the LEDs should be off before adding or removing components. Removing boards under power may result in system damage.

### Electrical Connection Configurations

There are a number of different connector types, such as EPS, ATX or terminal blocks, which can be utilized in wiring power supply and control functions to a PICMG 1.3 backplane. However, there are only two basic electrical connection configurations: **ACPI Connection** and **Legacy Non-ACPI Connection**.

#### ACPI Connection

The diagram on the previous page shows how to connect an ACPI compliant power supply to an ACPI enabled PICMG 1.3 system. The following table shows the required connections that must be made for soft power control to work.

<u>Signal</u>	<u>Description</u>	<u>Source</u>
+12	DC voltage for those systems that require it	Power Supply
+5V	DC voltage for those systems that require it	Power Supply
+3.3V	DC voltage for those systems that require it	Power Supply
+5VSB	5 Volt Standby. This DC voltage is always on when an ATX or EPS type power supply has AC voltage connected. 5VSB is used to keep the necessary circuitry functioning for software power control and wake up.	Power Supply
PWRGD	Power Good. This signal indicates that the power supply's voltages are stable and within tolerance.	Power Supply
PSON#	Power Supply On. This signal is used to turn on an ATX or EPS type power supply.	SHB/Backplane
PWRBT#	Power Button. A momentary normally open switch is connected to this signal. When pressed and released, this signals the SHB to turn on a power supply that is in an off state. If the system is on, holding this button for four seconds will cause the SHB's chipset to shut down the power supply. The operating system is not involved and therefore this is not considered a clean shutdown. Data can be lost if this situation occurs.	Power Button

#### Legacy Non-ACPI Connection

For system integrators that either do not have or do not require an ACPI compliant power supply as described in the section above, an alternative electrical configuration is described in the table on the following page.

<u>Signal</u>	<u>Description</u>	<u>Source</u>
+12	DC voltage for those systems that require it	Power Supply
+5V	DC voltage for those systems that require it	Power Supply
+3.3V	DC voltage for those systems that require it	Power Supply
+5VSB	Not Required	Power Supply
PWRGD	Not Required	Power Supply
PSON#	Power Supply On. This signal is used to turn on an ATX or EPS type power supply. If an ATX or EPS power supply is used in this legacy configuration, a shunt must be installed on the backplane from PSON# to signal Ground. This forces the power supply DC outputs on whenever AC to the power supply is active.	Backplane
PWRBT#	Not Used	

In addition to these connections, there is usually a switch controlling AC power input to the power supply.

When using the legacy electrical configuration, the SHB BIOS **Power Supply Shutoff** setting should be set to **Manual shutdown**. Refer to the *General ACPI Configuration* section of the *Advanced Setup* chapter in this manual for details.

*This page intentionally left blank*

## Chapter 4 PCI Express Backplane Usage

### SHB Edge Connectors and the Backplane SHB Slot

The PICMG<sup>®</sup> 1.3 specification enables SHB vendors to provide multiple PCI Express configuration options for edge connectors A and B of a particular SHB to support up to twenty (20) PCIe links. These edge connectors carry the twenty PCI Express links and reference clocks down to the SHB slot on the PICMG 1.3 backplane. The potential PCI Express link configurations of an SHB fall into three main classifications: server-class, graphics-class and combo-class. The specific class and PCI Express link configuration of an SHB is determined by the chipset components or Platform Controller Hub (PCH), and the processor(s) used on the board.

Server-class SHB configurations route as many high-bandwidth x8 and x4 PCI Express links as possible down to the backplane. Graphics-class configurations provide a x16 PCI Express link down to the backplane in order to support high-end PCI Express graphics and video cards plus one x4 PCIe link.

A combo-class configuration is provided by SHBs like the THD8141 or BXT7059. These system host board types have PCI Express hardware and software implementations that are capable of combining links to support either server or graphics-class PICMG 1.3 backplane configurations.

The A0, A2 and A3 PCI Express links on the THD8141 connect to the processor; via a PCI Express 3.0 link retimer, to the backplane. This retimer ensures optimum PCI Express Gen3 signal integrity between the SHB's processor and the end-point device on the backplane regardless of the device's location on the backplane. The A0, A2 and A3 links out of the THD8141 operate as either PCI Express 3.0, 2.0 or 1.1 links based on the end-point devices on the backplane. In addition to automatically configuring themselves for either PCIe 3.0, 2.0 or 1.1 operations, the links also configure themselves for either graphics or server-class operations. In other words, the two x4 links and the one x8 link from processor links A0, A2 and A3 can be combined into a single x16 PCIe electrical link or two x8 links on a backplane. The CPU's A2 and A3 x4 links can operate as x4 links of the backplane or train down to x1 links; however, these links cannot bifurcate into multiple x1 links.

---

**Note:** The THD8141's processor only supports a x8, x4 and x4 PCIe Gen3 root link configuration. This means that A0 cannot bifurcate into two x4 links. An SHB-to-backplane link configuration of A0=x4, A1=x4, A3=x4 and A3=x4 is **not possible** in the single Haswell board architecture of the THD8141.

---

The B0 PCIe link is from the board's Platform Controller Hub (PCH) and this link operates as either a x4 PCIe 2.0 or PCIe 1.1 interface. The board's Intel<sup>®</sup> C226 PCH enables automatic bifurcation of this x4 link into four individual x1 PCIe links on a suitably designed PICMG 1.3 backplane.

PCI Express link configuration straps for each PCI Express option card slot on a PICMG 1.3 backplane are required as part of the PICMG 1.3 specification. These configuration straps alert the SHB as to the specific link configuration expected on each PCI Express option card slot. PCI Express communication between the SHB and option card slots is successful only when there are enough available PCI Express links established between the PICMG 1.3 SHB and each PCI Express slot or device on the backplane.

In addition to the twenty standard PICMG 1.3 edge connector PCIe interfaces, the THD8141 board also has an additional x1 PCI Express 2.0 link available for use on a backplane. This extra x1 link originates at the processor and is routed through the SHB's on-board x1 PCIe switch to the SHB's two different controlled impedance connectors. These connectors (P20A or P20B) are for use with either the Trenton IOB33 or MPE40 plug-in option cards. One option card is supported at a time, and a card routes the available x1 PCI Express 2.0 expansion link down to a backplane equipped with a PCIe Expansion slot that connects to the card's x4 PCIe edge connector. This extra x1 electrical link is useful in supporting an additional system card slot or a PCIe end-point device such a PCI Express switch. Refer to Chapter 5, *Optional IOB33 Expansion Cards*, and Chapter 6 *MEP40 Expansion Cards* for more information on the IOB33 and the MPE40.

### THD8141 and Compatible Trenton Backplanes

Trenton Systems recommends the PICMG 1.3 backplanes noted in **green** in the table below for use with the THD8141 PICMG 1.3 system host board. The SHB will also function with a wide variety of non-Trenton, industry standard PICMG 1.3 backplanes. However, some non-Trenton backplanes may not utilize the full capabilities of the Trenton THD8141 boards. The table below illustrates the THD8141 compatibility with the current listing of Trenton PICMG 1.3 backplanes. A “Yes” in the compatible column below means that all slots on the backplane will function with a THD8141 board. The clarification column explains any limitations of using a THD8141 single processor SHB with a particular backplane. Visit our website to learn about the [latest Trenton PICMG 1.3 backplane availability listings](#).

PICMG 1.3 Backplane	Compatible with THD8141 (i.e. all backplane slots are functional)	Why not or clarification
<b>2U Butterfly Backplanes</b>		
BPC8219	Yes	All card slots operate at PCIe Gen2 speed
BPX8087	No	Multiple slots inactive due to no A1 link
BPG6741	Not recommended	Card slots operate at Gen1 speeds only
BPX6736*	Not recommended	Card slots operate at Gen1 speeds only
<b>Multi-Segment Backplanes</b>		
BP4FS6890	Yes – Graphics Configuration only Server Configuration is not recommended	Card slots operate at Gen1 speeds only Erratic PCIe link widths in the server configuration
BP2S6929	Yes	PCIe card slots operate at Gen1 speed
<b>Combo Backplanes</b>		
BPC7041	No	Multiple slots inactive due to no A1 link and no PCIe link expansion support
<b>Server-Class Backplanes</b>		
BPX8093	No, the THD8141 does not support the PEX10 for PCIe link expansion	PEX10 needed to provide the links for BP slots PCIe1 and PCIe2
BPX6806*	Yes, need IOB33/MPE40 for PCIe1 slot	THD8141 provides x1 via IOB33/MPE40
BPX6620	No	EOL pending
BPX6610*	Not recommended	Erratic link to the PCIe2 card slot
BPX6571	Not recommended	EOL
BPX3/14	No	Multiple slots inactive due to no A1 link and no PCIe link expansion support
BPX3/8	No	EOL
BPX6719	No	EOL pending
BPX3/2*	Not recommended	Slot PCIe2 operates at Gen1 link speed
BPX5*	Not recommended	Card slots operate at Gen1 speeds only with erratic PCIe link widths
<b>Graphics-Class Backplanes</b>		
BPG8194	Yes	All slots operate at PCIe Gen3 speeds with PCIe 3.0 cards except slot PCIe1. Maximum PCIe1 slot speed is PCIe 2.0.
BPG8155	Yes	All slots operate at PCIe Gen3 speeds with PCIe 3.0 cards except slot PCIe1. Maximum PCIe1 slot speed is PCIe 2.0.
BPG8150	No, the THD8141 does not support the PEX10 for PCIe link expansion	PEX10 needed to provide the links for BP slots PCIe 1 and PCIe2
BPG8032	Yes	All slots operate at PCIe Gen2 speeds
BPG7087	Yes, need IOB33/MPE40 for PCIe2 slot	THD8141 provides x1 via IOB33/MPE40
BPG6615	Not recommended	Erratic link to the PCIe2 card slot
BPG6600	Not recommended	Slot PCIe2 operates at Gen1 link speed
BPG6544	No	EOL pending
BPG6714	No	EOL pending
BPG2/2*	Not recommended	Slot PCIe2 operates at Gen1 link speed
BPG4*	Not recommended	THD8141 provides x1 via IOB33/MPE40

\*Backplane does not have an SHB edge connector D slot. The backplane will function OK, but the system designer should ensure the exposed SHB edge connector D pins are protected from potential damage

**NOTE:** Trenton SHBs that support the optional Ethernet routing to the card edge connectors support one backplane LAN interface. Some backplanes provide two optional LAN connectors as defined in the PICMG 1.3 specification, but *the second backplane LAN connector is not functional* with Trenton PICMG 1.3 system host boards.

*This page intentionally left blank*

## Chapter 5 Optional IOB33 I/O and PCIe Expansion Board

### IOB33 Overview

The IOB33 is optional I/O expansion board that may be used on the THD8141 SHB for the purpose of routing an additional x1 PCIe expansion link from the THD8141's PCH down to the PCIe Expansion Slot on a Trenton backplane. The IOB33 plugs into the THD8141's P20A controlled impedance connector.

An IOB33 may not be needed in the system application because most of the legacy I/O interfaces previously only on the IOB33 have been moved to the THD8141. The added IOB33 I/O capabilities available to the system designer include the following:

- Two - RS232 communication ports
- One - Floppy drive interface\*
- One - Parallel printer interface
- One - PS/2 Mini-DIN connector for PS/2 keyboard and mouse connections
  - May also include separate, on-board PS/2 keyboard and mouse headers for systems that require separate PS/2 connections

(\*Note: The floppy port header on the IOB33 is not functional when using the IOB33 with the THD8141 SBC.)

There are three versions of the Trenton IOB33 I/O expansion board. This optional board is designed for the THD8141 SHB, but the additional versions may be used on other Trenton SHBs. The chart below identifies the IOB33 version that is compatible with specific Trenton SHBs.

IOB Module	THD8141 (8141)	T4L (6483)	TML (6490)	TQ9 (6731)	MCG-Series (6680, 6690, 6675, 6695)	NLI / NLT (6313, 6396)	SLT / SLI (6515, 6521)	MCX-Series (6633, 6685, 6638, 6700)	JXT / JXTS (6966)
IOB33JX (7015-004)	X								X
IOB33MC (7015-002)				X	X			X	
IOB33 (7015-000)		X	X			X	X		

### IOB33 Models

Model #	Model Name	Description
7015-004	IOB33JX	Includes the I/O Plate for use with the THD8141, BXT7053/BXTS7053, JXT6966/JXTS6966 SHBs
7015-002	IOB33MC	Includes the I/O Plate for use with MCX, MCG and TQ9 system host boards
7015-000	IOB33	Includes the I/O Plate for use with TML, SLT, SLI NLT, NLI and T4L system host boards

**IOB33 Features**

IOB33 (7015-004, 7015-002, 7015-001)

- I/O plate versions for a variety of Trenton system host boards
- Two serial ports and PS/2 mouse/keyboard mini DIN on the I/O bracket
- PS/2 mouse, keyboard, parallel port and floppy\*\* drive connectors
- PCI Express expansion capability for use with PCI Express backplanes
- Compatible with PCI Industrial Computer Manufacturers Group (PICMG®) PCI Express Specification

*\*Except on the 7015-005 version of the IOB33*

*\*\* The floppy port header on the IOB33 is not functional when using the IOB33 with the THD8141 SBC.*

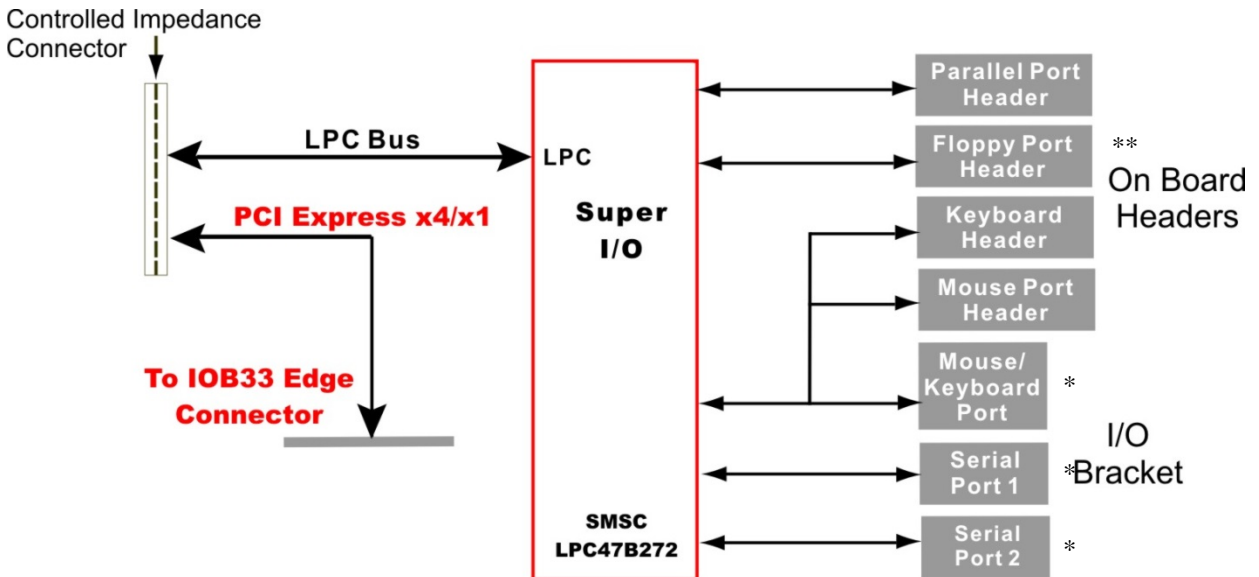

**IOB33 Temperature/Environment**

**Operating Temperature:** 0° C. to 60° C.

**Storage Temperature:** - 40° C. to 70° C.

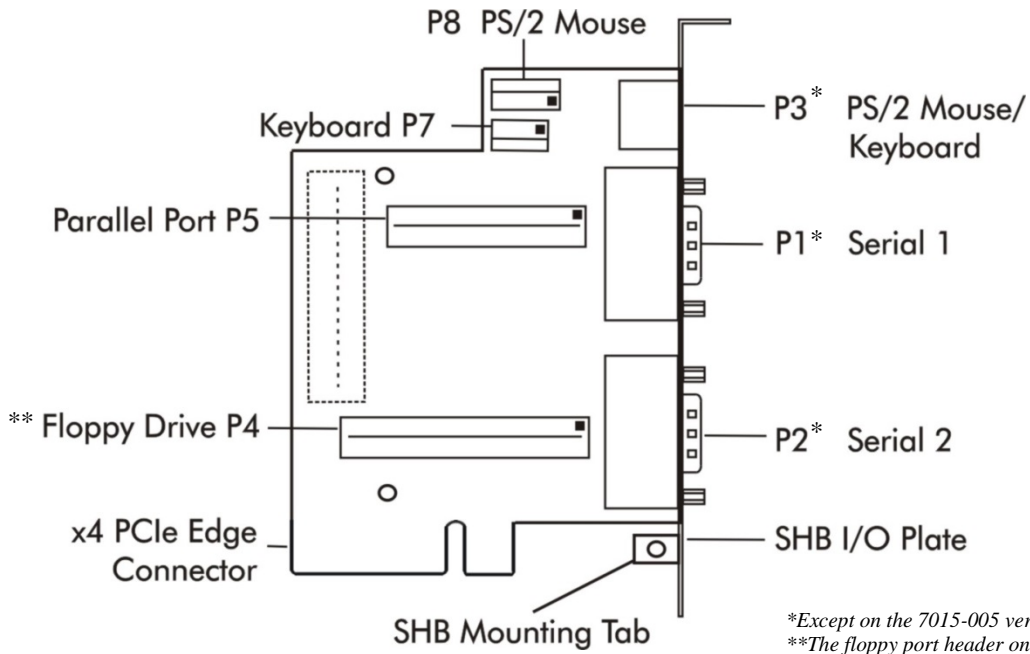

**Humidity:** 5% to 90% non-condensing

**IOB33 (7015-xxx) Block Diagram**

*\*Except on the 7015-005 versions of the IOB33*  
*\*\* The floppy port header on the IOB33 is not functional when using the IOB33 with the THD8141 SBC.*

## Chapter 6 *Optional MPE40 Media, I/O and PCIe Expansion Board*

### MPE40 Overview

The optional Trenton MPE40 card may also be used with the THD8141 SHB to provide an additional PCIe link to a backplane equipped with a PCI Express expansion slot. The Trenton BPG7087 and BPG6600 backplanes feature this PCI Express expansion slot. The MPE40 routes an additional PCIe x1 link available from the THD8141's PCH via an on-board PCI Express switch down to a backplane for use in PCI Express link and/or bandwidth expansion. This additional link may operate at the PCIe 2.0 or PCIe 1.1 link interface speed depending on the backplane and end-point configuration.

The MPE40 board plugs into connectors P20A and P20B on the THD8141 to provide PCIe link expansion to a compatible PICMG 1.3 backplane, legacy I/O and audio interface support, as well as system support for an additional DVI-D video interface.

### MPE40 Media Expansion Board – Additional DVI-D Video Interface

Haswell processors feature additional video interfaces, but the required connectors could not be accommodated in the THD8141 design due to SHB size limitations. However, an additional DVI-D video interface can be supported on the THD8141 by using the optional MPE40 card. The MPE40 is a mezzanine board that plugs into the SHB's P20A and P20B controlled impedance connectors to provide an additional DVI-D Port video connection at the rear of the system chassis. All THD8141 video interfaces are made possible by use of the optional MPE40 may be used simultaneously.

### MPE40 Media Expansion Board – Audio Port Interfaces

The Intel® C226 PCH supports an audio CODEC connection. The MPE40 utilizes a Hi-Def audio CODEC ALC262D to decode these audio signals. The MPE40 mezzanine board plugs into the SHB's two high impedance connectors (P20A and P20B) to provide LINE In and LINE Out connections at the rear of the system chassis as well as an AC97 HD audio header connection.

Most of the legacy I/O interfaces on the MPE40 have been moved to the THD8141. Additional legacy I/O MPE40 includes the following added interfaces for use by the system designer:

- One - Floppy drive interface\*
- One - Parallel printer interface
- One – PS/2 Mini-DIN connector for PS/2 keyboard and mouse connections
  - Also includes separate, on-board PS/2 keyboard and mouse headers for systems that require separate PS/2 connections

*\* The floppy port header on the MPE40 is not functional when using the MPE40 with the THD8141 SBC.*

### MPE40 Model

Model #	Model Name	Description
8226-001	MPE40d	Includes the I/O Plate for use with the THD8141, PCIe, I/O, Video and audio expansion with a THD8141 SHB with an MPE40 I/O bracket featuring an additional DVI-D video connector.

**MPE40 Features**

MPE40d (8226-001)

- I/O plate compatible with the Trenton THD8141 system host board
- DVI-D port, Audio Line In and Audio Line Out connectors on the I/O bracket
- PS/2 mouse, keyboard, parallel port and floppy\* drive connectors
- PCI Express expansion capability for use with PCI Express backplanes
- Compatible with PCI Industrial Computer Manufacturers Group (PICMG®) PCI Express Specification

*\* The floppy port header on the MPE40 is not functional when using the MPE40 with the THD8141 SBC.*

**MPE40 Temperature/Environment**

**Operating Temperature:** 0° C. to 60° C.

**Storage Temperature:** - 40° C. to 70° C.

**Humidity:** 5% to 90% non-condensing

**MPE40d (8226-001) Block Diagram**

*\*\* The floppy port header on the MPE40d is not functional when using the MPE40d with the THD8141 SBC.*

**NOTE:** When an MPE40 is connected to the THD8141’s P20A and P20B controlled impedance connectors, a second Super I/O chip is placed into the system by virtue of the LPC Bus routing through the controlled impedance connector P20A. The audio and video interface connectors on the MPE40 I/O bracket connect to the THD8141 via controlled impedance connector P20B. The PCIe x1 link routing to a PICMG 1.3 backplane expansion slot works fine with the current THD8141 BIOS revision.

## Appendix A BIOS Messages

### Introduction

A status code is a data value used to indicate progress during the boot phase. These codes are outputted to I/O port 80h on the SHB. Aptio 4.x core outputs checkpoints throughout the boot process to indicate the task the system is currently executing. Status codes are very useful in aiding software developers or technicians in debugging problems that occur during the pre-boot process.

### Aptio Boot Flow

While performing the functions of the traditional BIOS, Aptio 4.x core follows the firmware model described by the Intel Platform Innovation Framework for EFI (“the Framework”). The Framework refers the following “boot phases”, which may apply to various status code descriptions:

- Security (SEC) – initial low-level initialization
- Pre-EFI Initialization (PEI) – memory initialization<sup>1</sup>
- Driver Execution Environment (DXE) – main hardware initialization<sup>2</sup>
- Boot Device Selection (BDS) – system setup, pre-OS user interface & selecting a bootable device (CD/DVD, HDD, USB, Network, Shell, ...)

<sup>1</sup> Analogous to “bootblock” functionality of legacy BIOS

<sup>2</sup> Analogous to “POST” functionality in legacy BIOS

### BIOS Beep Codes

The Pre-EFI Initialization (PEI) and Driver Execution Environment (DXE) phases of the Aptio BIOS use audible beeps to indicate error codes. The number of beeps indicates specific error conditions.

### PEI Beep Codes

# of Beeps	Description
1	Memory not Installed
1	Memory was installed twice (InstallPeiMemory routine in PEI Core called twice)
2	Recovery started
3	DXEIPL was not found
3	DXE Core Firmware Volume was not found
7	Reset PPI is not available
4	Recovery failed
4	S3 Resume failed

**DXE Beep Codes**

<b># of Beeps</b>	<b>Description</b>
4	Some of the Architectural Protocols are not available
5	No Console Output Devices are found
5	No Console Input Devices are found
1	Invalid password
6	Flash update is failed
7	Reset protocol is not available
8	Platform PCI resource requirements cannot be met

**BIOS Status Codes**

As the POST (Power On Self Test) routines are performed during boot-up, test codes are displayed on Port 80 POST code LEDs 0, 1, 2, 3, 4, 5, 6 and 7. These LED are located on the top of the SHB, just above the board’s battery socket. The POST Code LEDs and are numbered from right (position 1 = LED0) to left (position 8 – LED7).

The POST code checkpoints are the largest set of checkpoints during the BIOS pre-boot process. The following chart is a key to interpreting the POST codes displayed on LEDs 0 through 7 on the THD8141 SHB. Refer to the board layout in the *Specifications* chapter for the exact location of the POST code LEDs.

The HEX to LED chart in the POST Code LEDs section will serve as a guide to interpreting specific BIOS status codes.

**BIOS Status POST Code LEDs**

As the POST (Power On Self Test) routines are performed during boot-up, test codes are displayed on Port 80 POST code LEDs 0, 1, 2, 3, 4, 5, 6 and 7. These LED are located on the top of the SHB, just above the board’s SATA connectors and slightly toward the right. The POST Code LEDs and are numbered from right (position 1 = LED0) to left (position 8 – LED7).

The POST code checkpoints are the largest set of checkpoints during the BIOS pre-boot process. The following chart is a key to interpreting the POST codes displayed on LEDs 0 through 7 on the THD8141 SHB. Refer to the board layout in the *Specifications* chapter for the exact location of the POST code LEDs.

9	On	Off	Off	On
A	On	Off	On	Off
B	On	Off	On	On
C	On	On	Off	Off
D	On	On	Off	On
E	On	On	On	Off
F	On	On	On	On

**THD8141 POST Code LEDs**  
(Labeled 1 through 8 on Rev0 boards)

**Status Code Ranges**

<b>Status Code Range</b>	<b>Description</b>
0x01 – 0x0F	SEC Status Codes & Errors
0x10 – 0x2F	PEI execution up to and including memory detection
0x30 – 0x4F	PEI execution after memory detection
0x50 – 0x5F	PEI errors
0x60 – 0xCF	DXE execution up to BDS
0xD0 – 0xDF	DXE errors
0xE0 – 0xE8	S3 Resume (PEI)
0xE9 – 0xEF	S3 Resume errors (PEI)
0xF0 – 0xF8	Recovery (PEI)
0xF9 – 0xFF	Recovery errors (PEI)

**SEC Status Codes**

<b>Status Code</b>	<b>Description</b>
0x0	Not used
<b>Progress Codes</b>	
0x1	Power on. Reset type detection (soft/hard).
0x2	AP initialization before microcode loading
0x3	North Bridge initialization before microcode loading
0x4	South Bridge initialization before microcode loading
0x5	OEM initialization before microcode loading
0x6	Microcode loading
0x7	AP initialization after microcode loading
0x8	North Bridge initialization after microcode loading
0x9	South Bridge initialization after microcode loading
0xA	OEM initialization after microcode loading
0xB	Cache initialization
<b>SEC Error Codes</b>	
0xC – 0xD	Reserved for future AMI SEC error codes
0xE	Microcode not found
0xF	Microcode not loaded

**SEC Beep Codes**

There are no SEC Beep codes associated with this phase of the Aptio BIOS boot process.

**PEI Status Codes**

<b>Status Code</b>	<b>Description</b>
<b>Progress Codes</b>	
0x10	PEI Core is started
0x11	Pre-memory CPU initialization is started
0x12	Pre-memory CPU initialization (CPU module specific)
0x13	Pre-memory CPU initialization (CPU module specific)
0x14	Pre-memory CPU initialization (CPU module specific)
0x15	Pre-memory North Bridge initialization is started
0x16	Pre-Memory North Bridge initialization (North Bridge module specific)
0x17	Pre-Memory North Bridge initialization (North Bridge module specific)
0x18	Pre-Memory North Bridge initialization (North Bridge module specific)
0x19	Pre-memory South Bridge initialization is started
0x1A	Pre-memory South Bridge initialization (South Bridge module specific)
0x1B	Pre-memory South Bridge initialization (South Bridge module specific)
0x1C	Pre-memory South Bridge initialization (South Bridge module specific)
0x1D – 0x2A	OEM pre-memory initialization codes
0x2B	Memory initialization. Serial Presence Detect (SPD) data reading
0x2C	Memory initialization. Memory presence detection
0x2D	Memory initialization. Programming memory timing information
0x2E	Memory initialization. Configuring memory
0x2F	Memory initialization (other).
0x30	Reserved for ASL (see ASL Status Codes section below)
0x31	Memory Installed
0x32	CPU post-memory initialization is started
0x33	CPU post-memory initialization. Cache initialization
0x34	CPU post-memory initialization. Application Processor(s) (AP) initialization
0x35	CPU post-memory initialization. Boot Strap Processor (BSP) selection
0x36	CPU post-memory initialization. System Management Mode (SMM) initialization
0x37	Post-Memory North Bridge initialization is started
0x38	Post-Memory North Bridge initialization (North Bridge module specific)
0x39	Post-Memory North Bridge initialization (North Bridge module specific)
0x3A	Post-Memory North Bridge initialization (North Bridge module specific)
0x3B	Post-Memory South Bridge initialization is started
0x3C	Post-Memory South Bridge initialization (South Bridge module specific)
0x3D	Post-Memory South Bridge initialization (South Bridge module specific)
0x3E	Post-Memory South Bridge initialization (South Bridge module specific)
0x3F-0x4E	OEM post memory initialization codes
0x4F	DXE IPL is started

<b>PEI Error Codes</b>	
0x50	Memory initialization error. Invalid memory type or incompatible memory speed
0x51	Memory initialization error. SPD reading has failed
0x52	Memory initialization error. Invalid memory size or memory modules do not match.
0x53	Memory initialization error. No usable memory detected
0x54	Unspecified memory initialization error.
0x55	Memory not installed
0x56	Invalid CPU type or Speed
0x57	CPU mismatch
0x58	CPU self test failed or possible CPU cache error
0x59	CPU micro-code is not found or micro-code update is failed
0x5A	Internal CPU error
0x5B	reset PPI is not available
0x5C-0x5F	Reserved for future AMI error codes
<b>S3 Resume Progress Codes</b>	
0xE0	S3 Resume is started (S3 Resume PPI is called by the DXE IPL)
0xE1	S3 Boot Script execution
0xE2	Video repost
0xE3	OS S3 wake vector call
0xE4-0xE7	Reserved for future AMI progress codes
0xE0	S3 Resume is started (S3 Resume PPI is called by the DXE IPL)
<b>S3 Resume Error Codes</b>	
0xE8	S3 Resume Failed in PEI
0xE9	S3 Resume PPI not Found
0xEA	S3 Resume Boot Script Error
0xEB	S3 OS Wake Error
0xEC-0xEF	Reserved for future AMI error codes
<b>Recovery Progress Codes</b>	
0xF0	Recovery condition triggered by firmware (Auto recovery)
0xF1	Recovery condition triggered by user (Forced recovery)
0xF2	Recovery process started
0xF3	Recovery firmware image is found
0xF4	Recovery firmware image is loaded
0xF5-0xF7	Reserved for future AMI progress codes
<b>Recovery Error Codes</b>	
0xF8	Recovery PPI is not available
0xF9	Recovery capsule is not found
0xFA	Invalid recovery capsule
0xFB – 0xFF	Reserved for future AMI error codes

**PEI Beep Codes**

# of Beeps	Description
1	Memory not Installed
1	Memory was installed twice (InstallPeiMemory routine in PEI Core called twice)
2	Recovery started
3	DXE IPL was not found
3	DXE Core Firmware Volume was not found
7	Reset PPI is not available
4	Recovery failed
4	S3 Resume failed

**DXE Status Codes**

Status Code	Description
0x60	DXE Core is started
0x61	NVRAM initialization
0x62	Installation of the South Bridge Runtime Services
0x63	CPU DXE initialization is started
0x64	CPU DXE initialization (CPU module specific)
0x65	CPU DXE initialization (CPU module specific)
0x66	CPU DXE initialization (CPU module specific)
0x67	CPU DXE initialization (CPU module specific)
0x68	PCI host bridge initialization
0x69	North Bridge DXE initialization is started
0x6A	North Bridge DXE SMM initialization is started
0x6B	North Bridge DXE initialization (North Bridge module specific)
0x6C	North Bridge DXE initialization (North Bridge module specific)
0x6D	North Bridge DXE initialization (North Bridge module specific)
0x6E	North Bridge DXE initialization (North Bridge module specific)
0x6F	North Bridge DXE initialization (North Bridge module specific)
0x70	South Bridge DXE initialization is started
0x71	South Bridge DXE SMM initialization is started
0x72	South Bridge devices initialization
0x73	South Bridge DXE Initialization (South Bridge module specific)
0x74	South Bridge DXE Initialization (South Bridge module specific)
0x75	South Bridge DXE Initialization (South Bridge module specific)
0x76	South Bridge DXE Initialization (South Bridge module specific)
0x77	South Bridge DXE Initialization (South Bridge module specific)
0x78	ACPI module initialization
0x79	CSM initialization

0x7A – 0x7F	Reserved for future AMI DXE codes
0x80 – 0x8F	OEM DXE initialization codes
0x90	Boot Device Selection (BDS) phase is started
0x91	Driver connecting is started
0x92	PCI Bus initialization is started
0x93	PCI Bus Hot Plug Controller Initialization
0x94	PCI Bus Enumeration
0x95	PCI Bus Request Resources
0x96	PCI Bus Assign Resources
0x97	Console Output devices connect
0x98	Console input devices connect
0x99	Super IO Initialization
0x9A	USB initialization is started
0x9B	USB Reset
0x9C	USB Detect
0x9D	USB Enable
0x9E – 0x9F	Reserved for future AMI codes
0xA0	IDE initialization is started
0xA1	IDE Reset
0xA2	IDE Detect
0xA3	IDE Enable
0xA4	SCSI initialization is started
0xA5	SCSI Reset
0xA6	SCSI Detect
0xA7	SCSI Enable
0xA8	Setup Verifying Password
0xA9	Start of Setup
0xAA	Reserved for ASL (see ASL Status Codes section below)
0xAB	Setup Input Wait
0xAC	Reserved for ASL (see ASL Status Codes section below)
0xAD	Ready To Boot event
0xAE	Legacy Boot event
0xAF	Exit Boot Services event
0xB0	Runtime Set Virtual Address MAP Begin
0xB1	Runtime Set Virtual Address MAP End
0xB2	Legacy Option ROM Initialization
0xB3	System Reset
0xB4	USB hot plug
0xB5	PCI bus hot plug
0xB6	Clean-up of NVRAM
0xB7	Configuration Reset (reset of NVRAM settings)

0xB8 – 0xBF	Reserved for future AMI codes
0xC0 – 0xCF	OEM BDS initialization codes
<b>DXE Error Codes</b>	
0xD0	CPU initialization error
0xD1	North Bridge initialization error
0xD2	South Bridge initialization error
0xD3	Some of the Architectural Protocols are not available
0xD4	PCI resource allocation error. Out of Resources
0xD5	No Space for Legacy Option ROM
0xD6	No Console Output Devices are found
0xD7	No Console Input Devices are found
0xD8	Invalid password
0xD9	Error loading Boot Option (LoadImage returned error)
0xDA	Boot Option is failed (StartImage returned error)
0xDB	Flash update is failed
0xDC	Reset protocol is not available

**DXE Beep Codes**

# of Beeps	Description
4	Some of the Architectural Protocols are not available
5	No Console Output Devices are found
5	No Console Input Devices are found
1	Invalid password
6	Flash update is failed
7	Reset protocol is not available
8	Platform PCI resource requirements cannot be met

**ACPI/ASL Status Codes**

<b>Status Code</b>	<b>Description</b>
0x01	System is entering S1 sleep state
0x02	System is entering S2 sleep state
0x03	System is entering S3 sleep state
0x04	System is entering S4 sleep state
0x05	System is entering S5 sleep state
0x10	System is waking up from the S1 sleep state
0x20	System is waking up from the S2 sleep state
0x30	System is waking up from the S3 sleep state
0x40	System is waking up from the S4 sleep state
0xAC	System has transitioned into ACPI mode. Interrupt controller is in PIC mode.
0xAA	System has transitioned into ACPI mode. Interrupt controller is in APIC mode.

**OEM-Reserved Status Code Ranges**

<b>Status Code</b>	<b>Description</b>
0x5	OEM SEC initialization before microcode loading
0xA	OEM SEC initialization after microcode loading
0x1D – 0x2A	OEM pre-memory initialization codes
0x3F – 0x4E	OEM PEI post memory initialization codes
0x80 – 0x8F	OEM DXE initialization codes
0xC0 – 0xCF	OEM BDS initialization codes
