WHAT YOU NEED TO KNOW ABOUT OXAMYL

To learn more about ReTurn®, call:
1 (866) 927-6826

Growers have relied on a comprehensive program to suppress nematodes for years.

A combination of seed treatments, organic amendment materials and applications of oxamyl was an effective way to keep harmful nematodes suppressed. When oxamyl disappeared from the market a few years ago, some growers have had a difficult time keeping nematodes at bay.

Seed treatments are often not enough to fight nematodes. Successful management of nematodes does require a fully integrated approach. Using only one type of product is only one part of a sustainable solution in combating nematodes in fruits and vegetables.

ReTurn with Oxamyl is a valuable part of an integrated approach and the benefits are clear.

To protect birds and other mammals, the product can be **INCORPORATED INTO THE SOIL** and fully incorporated at the end of rows.

ReTurn with oxamyl can also be safely applied with drip tape so the chemical compound doesn't come into contact with workers applying the nematicide.

Oxamyl protects plants with dual action.

Oxamyl works as both a nematicide and an insecticide. It acts directly on the acetylcholinesterase receptors and paralyzes the pests.

REDUCE feeding, movement, reproduction and hatching

by providing suppression of certain nematode species with Oxamyl. As it moves systemically, the oxamyl product accumulates in young, actively growing roots and stops feeding quickly.

NO PROBLEM, NO TREATMENT.

According to one study, an advantage of using oxamyl is that growers don't need to treat until a nematode problem occurs. But, if the grower does anticipate a nematode problem using soil samples, the oxamyl can be applied at planting.

Oxamyl WORKS FAST

to suppress aphids, mites, thrips, leafminers, weevils, leafhoppers and more pests that threaten crop yields.

Oxamyl is a **cost-effective** supplement to help suppress nematodes for **HEALTHIER PLANTS.**

Products that use Oxamyl are **MORE ECONOMICAL** than some other methods of suppressing root knot nematodes.
