

Interactive Data Access

Exploring the Possibilities With TrialMaster Data Grids

Rich Davies

Executive Director Of Business Solutions

24th March, 2017

The EDC of choice for over
5,000 clinical trials around the world

An anecdotal example from last week

- CRO organized an Ad-Hoc Reporting demo for customer
- Showed process of creating reports and the types of output possible in ad-hoc
- Customer didn't need flexibility to self-create reports
- Customer didn't need graphical representation of data
- Discussed creating a custom export of 'just' the data they needed
- Ideally wanted to run the export themselves
- Isolated customer requirement to needing a fixed report (listing) in MS Excel that they could trigger as required
- Ideal solution then identified as a TrialMaster Data Grid

Business Challenges/Need

- EDC Users find it helpful to access summarized clinical data that:
 - Is accessed all in one place – no skipping through multiple eCRFs
 - Is *just* the eCRF questions required for review
 - Can contain calculated data
 - Is *restricted* to desired content and can be further sorted/filtered by the user
 - Can be executed at the patient, site or trial level
 - Can link back to the associated eCRFs
 - Can be exported quickly for utilization outside of TrialMaster
 - Can be exported into custom PDF forms

Solution Overview – What are Data Grids ?

- Data Grids are tabular views of data collected within a trial
- Any number of Data Grids can be defined for a trial and the content is configurable when they are defined
- A user can select the whole trial, a site or a subject and run a Data Grid to view the content
- Data Grids can also be mapped to PDF form documents to export the content in a pre-defined format.

Solution Overview - Example – All Trial Adverse Events

How do Data Grids compare to ad-hoc reporting ?

- Ad-hoc reports also provide custom views of clinical data
- However:
 - Ad-hoc reporting is typically a CRO/Sponsor tool and not granted to Sites. Data Grids easily accessible to all.
 - Data Grids cannot be configured on the fly, they're built in TrialBuilder and deployed with the trial or any MSC.
 - Data Grids are tabular, while ad-hoc reports can be graphical

Who Benefits & How

- Target Users:
 - Investigators who may be interested in key endpoint data
 - Monitors who may be interested in dropouts or protocol deviations
 - Data Managers who may be interested in reconciling data across eCRFs
 - Medical Reviewers interested in out of range lab data
 - Pharmacovigilance interest in AE related data
- The use cases are varied and the value of data grids applicable to multiple user types.

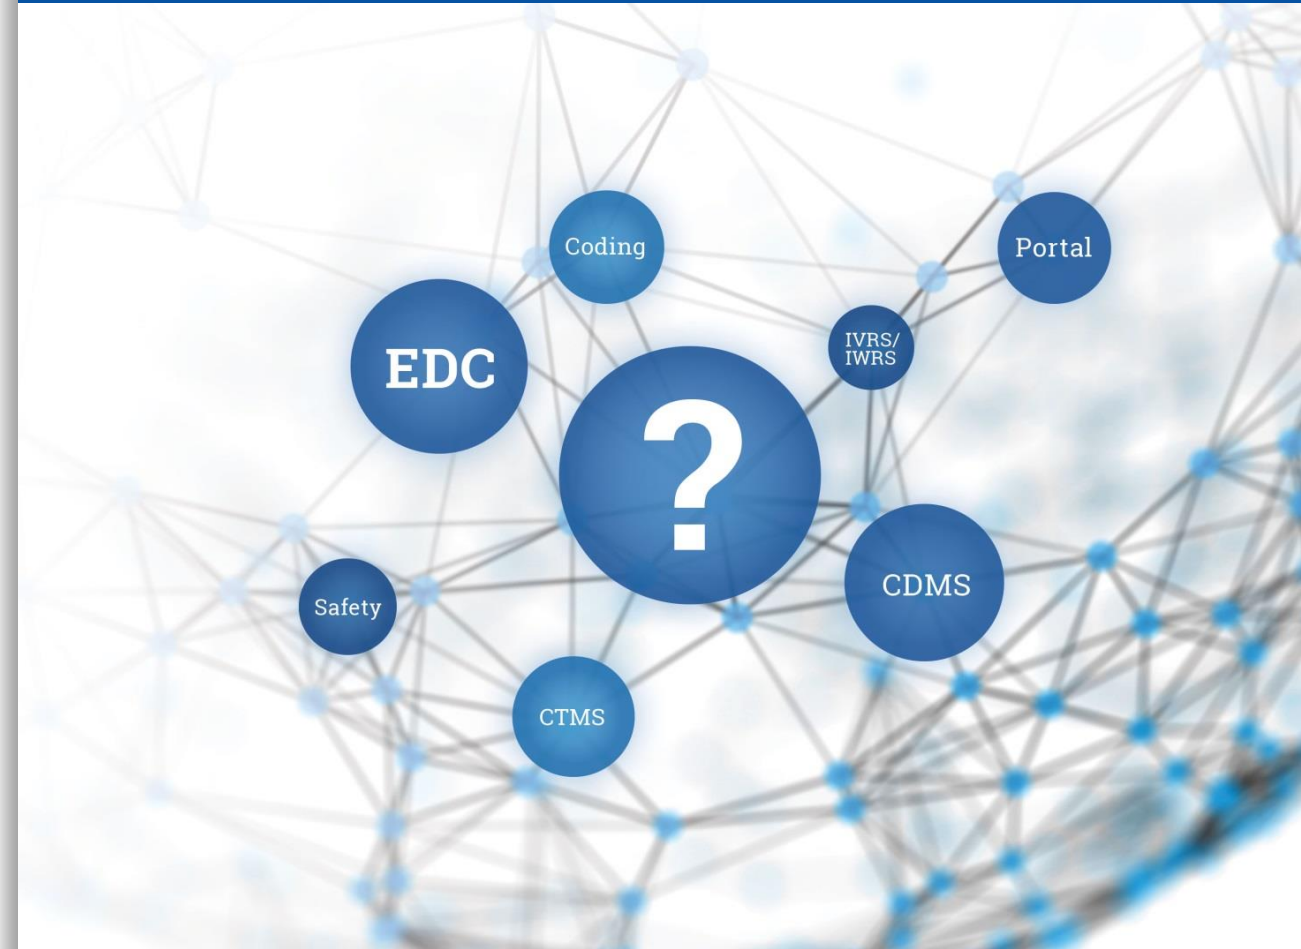

Value Summary

- Applicable to many user types
- Quick to access
- Allows users to have targeted data review
- Flexible content to support varied use cases
- Streamlined user experience for data review
- Easily output data into sponsor-defined PDF documents
