

Inform Distribution Center

DDI System's Warehouse Management Solution

Give your business the functionality to help streamline warehouse operations with industry leading features like wireless bar code scanning, customized pick paths, and real-time order and inventory management. **Inform's Distribution Center Software (DC)** is built on the Inform ERP platform so it interacts seamlessly with your business management. DC is designed to achieve high-efficiency and error-free inventory handling for single and multi-location warehouses, to optimize operations.

Wireless Warehouse

Achieve greater control over your entire inventory. Advanced features help breakdown on-hand product quantities by bin location, optional tracking of serialized products, physical inventory count efficiencies, and system-generated tasks.

Inventory Lookup

View inventory quantities for a product or choose a new primary bin location by scanning the product's barcode, entering the product number, or by entering the product's description.

Dynamic Lookup

Get the details you need with any type of inquiry. Scan any barcode and relevant information including serial numbers, lots, bin locations, inventory and orders are displayed. For example, product scans show inventory and bin locations. A sales order lookup will provide real-time pick progress.

Sales Order Picking

Flexible pick control helps minimize footsteps to maximize productivity. Pick sales orders by individual order or by truck. Pick routes are then assigned by bin location. The single step 'Load' option allows you to bypass the 2-step process and load directly from the bin locations.

Customizable Pick Path

Reduce the amount of time it takes to pick orders with customizable bin sequencing. Define your own pick path which may include picking the heaviest products first or pulling inventory out of specific warehouse areas.

Zone Picking/Order Sharing

Pickers can share workloads so multiple people can work on the same order simultaneously. Quickly split orders into "zones," allowing pickers to work in different sections of the warehouse without any overlap.

Warehouse Transfers

Simply and accurately transfer product from one branch location to another. Maintain accurate inventory and avoid transfer delays.

Stock Receiving

Receive vendor stock or stock transfers directly through the handheld wireless warehouse gun to ensure accurate inventory and bin assignment at all times. Print product labels instantly for all special order items and items without barcodes at the time of receiving.

Bin Assignment

Inform's WMS can be set up as either a Primary Bin Warehouse or a Floating Bin Warehouse based on your business needs. Pick lists are based on bin assignments with the option of FIFO (first in, first out) logic when necessary.

Combine and Share Receivings

Multiple receivers can scan items and receive off the same purchase order. This is taken one step further by allowing multiple orders from the same vendor to be temporarily combined for the duration of the receiving process.

Achieve High Efficiency & Accuracy for Single or Multi-Location Businesses

Real-Time Dashboard & Analytics

Gain detailed insight into every aspect of your warehouse with powerful KPI's that track both picker and receiver performance. In addition, a real-time dashboard shows the day's progress towards order completion allowing warehouse managers to better allocate resources.

Job Dispatcher

Warehouse managers will be able to assign specific jobs such as bin counts, order picks, or replenishments to specific individuals using a simple drag and drop style screen. Jobs will instantly appear on each user's wireless scanner.

Scheduled Bin Counts

Recommended counts (currently available by product ranking) can soon be automatically scheduled by bin location and assigned via the Job Queue. Discrepancies (for recount) will also appear in the Job Queue allowing for a truly paperless count.

Improved Bin Replenishment

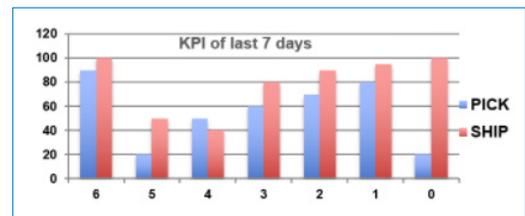

Transferring products from overflow locations is made easier by establishing Min & Max quantities for your Primary, Showroom, or Counter locations. Excess inventory appears in the Job Queue, automating the replenishment process.

Lot Tracking

The in-depth lot tracking capabilities of Inform now extend to the warehouse. Upon receiving lot enabled products you'll be prompted to assign lots along with expiration dates. Order picking will prioritize date driven lot quantities using FIFO based logic.

Wireless/Paperless Warehouse

The automatic paperless job queue generates task lists to maintain warehouse efficiency and accuracy. Tasks such as SO picking, user-specified spot checks, primary bin replenishment, stock 'put away', discrepancy checks and elevate warehouse productivity.

Real-Time Dashboard Analytics

Initials	Name	Job Count
AG	Andy Garcia	6
BM	Brian McCarthur	6
Bin Transfer	1260001	3 from DOCK to 06-12-02
Bin Transfer	EDG AB111	5 from DOCK to 07-13-02
Order Pull	173687	A1 Heating & Air
Order Pull	173712-01	Bob's Refrigeration
Product Count	RIT 60142	On-Hand: 25, Bins Qty: 0, Diff: 25
Product Count	ARM 56W55	On-Hand: 300, Bins Qty: 0, Diff: 300
DP	Damien Peach	27
DM	Danny Maclosky	11

Job Dispatcher

"It's fantastic how intuitive and easy this system is. Any new hires or temps we use are up to speed within an hour. During our busy season this is a huge benefit so we are not spending valuable time training temporary employees."

Dominic Carusi, V.P. Finance & Operations
