BOVINE TRACHEAL CARTILAGE IN THE TREATMENT OF CANCER

DAVID KIRCHHOF, D.C.
AND
ELISABETH KIRCHHOF, N.D.

Introduction

Since 1954, when bovine tracheal cartilage was discovered to promote wound healing, it has been proven effective in treating a wide range of clinical conditions from inflammatory diseases to cancer. Although the documentation has been a slow and meticulous process, its effectiveness in the treatment of cancer and other diseases represents a significant advance. This booklet will focus on its efficacy in the treatment of cancer.

During this initial investigative period, more than 1,000 patients have been treated with bovine cartilage and over 100 cancer patients have benefited from its use. Follow-up on these cancer patients has been meticulous.

It is anticipated that many more patients will benefit from the use of bovine cartilage through increased awareness of its efficacy.
