

B9Creator Technology

The B9Creator is a DLP (digital light processing)-based printer. DLP is a similar process to stereolithography in that it is a 3D printing process that works with liquid photopolymers. The major difference is the light source. DLP uses a conventional light source to project an entire slice/layer of the model being printed, making it faster than laser-based SL, which traces the cross-section of every model on every layer.

Applications

Jewelry

Jewelers around the world rely on the B9Creator for its outstanding speed, resolution, and surface finish to move quickly from design to casting. Printing even the smallest prongs and filigree, and ability to cast our resin in a traditional casting process, combined with an affordable purchase price make the B9Creator a perfect fit. Typical consumables costs under \$1.50 per ring ensure that capability doesn't hurt your profitability.

Universities/Research

Our technology, innovative software, and empowering design provide micro-detail, surface finish, and speed researchers require to break through barriers and move their fields of study forward. User-defined parameters for the curing process at the level of voxel resolution allow university researchers to tune the B9Creator to work with a variety of material properties, allowing for use of 3rd party resins and experimental materials.

Hobbyist

Whether using the B9Creator as part of their business creating & selling miniatures, performing restoration of collectable models, or simply creating for fun, owners love the detail, toughness, paintability, & speed of our output.
