

***SHEAR* FORCE**

Soft Armor Rock Solid Protection

TM

12

Introducing: ShearForce12™ High Flow Scour Control Transition Mat.

The patent pending ShearForce12 High Flow Scour Control Transition Mat incorporates a ½ inch thick, weather resistant, perforated rubber core layered between a green, simulated turf monolithic polyethylene structure and an engineered geotextile fabric.

Unlike other scour transition mats that require a separate TRM underlayment for sufficient initial erosion protection, ShearForce12 is an all-in-one, 3ft x 4ft, 30lb panel, that's simply installed directly on top of the seeded soil surface.

The simulated grass blades of the turf structure are designed to deflect rainfall impact and flow induced shear stress away from the apertures in the rubber core and the fabric backing. The turf structure further increases surface roughness when used in flow transition areas to slow water flow and reduce turbulence.

The rubber core provides an enhanced ballast effect and flow impact resistance, while vegetation grows up through its 1.5 inch apertures.

Proven in ASTM D6460 Unvegetated Channel Testing without vegetation to virtually eliminate soil erosion at flow-induced shear stresses exceeding 12 lbs/sf, ShearForce12 Mats offer immediate as well as permanent erosion protection equivalent to 36 inch rock riprap! ShearForce12 Mats are ideal for areas subject to substantial wave action and very turbulent, high shear stress water flows.

Pictured from the top: ShearForce12 comes in easy to handle and install 3ft x 4ft panels. ShearForce12 under intense water flow in ASTM D6460 Large Scale Channel testing.

Features and Benefits of ShearForce12 mats include:

- Maximum performance from day one, no waiting on vegetation for effective scour protection at shear stress > 12 lbs/sf
- All-in-one scour transition mat, NO additional TRM or other erosion control underlay required
- Cost-effective scour control alternative to large rock riprap and other hard armor systems
- Simple installation, just lay it and anchor it, no heavy equipment required
- Aesthetically pleasing, green grassed-in finished look
- Environmentally friendly, facilitates water filtration and infiltration
- Highly UV stable and weather resistant, for permanent strength and durability
- Easy, low-cost maintenance with standard mowing equipment

Typical Applications for ShearForce12 mats

- High discharge culvert and pipe outfalls, and other flow transition areas
- Turbulent flow drainage channels, including those with constant low-flow discharge
- Detention basin, pond and lake shorelines (below/above normal waterline)
- Lake, river and canal banks (below/above normal waterline)
- Extreme downchutes from parking lots and other areas with substantial grade change
- Levees and spillways
- Areas where vegetation establishment is very slow and sparse

Recommended Design Values

ShearForce12™ Scour Control Mat	Channels/Outfalls/Spillways/Streambanks*				Slopes		Shorelines
	Manning's n	Design Shear Stress		Design Velocity		Max Gradient (h:v)	Max Wave Height
		Cohesive Soils	Non-Cohesive Soils	Cohesive Soils	Non-Cohesive Soils		
ShearForce12 Unvegetated	.025 – .040	14 lbs/sf	12 lbs/sf	30 ft/sec	25 ft/sec	>1:1	<=1.5 ft
ShearForce12 Vegetated	.025 – .4	18 lbs/sf	16 lbs/sf	30 ft/sec	25 ft/sec	>1:1	<=2.0 ft

* Design values are derived from ASTM D6460 large-scale channel testing on loam soils under 4 consecutive 30 min flow events in 20% gradient test flumes. A safety factor (SF) of 1.25 - 2.0 may be applied in channel lining designs to account for longer flow durations, more erodible soils, and varying side-slope gradients.
