RETICULATED POLYURETHANE FOAM 10ppi
A coarse porosity, 10 PPI, reticulated foam is effective as a sound attenuator, scrubber pad, washable filtration media for air conditioners, furnaces, small engines and automobile air cleaners, plus many other applications.

When reticulated foam is compressed, the material takes on a new set of properties ideal for other applications requiring high void volumes, uniform porosity, non-directional characteristics, exceptional breathability and uniform texture. Reticulated foam is often compressed and used for creating ink rollers, blood filters, and other products requiring wicking properties.
