December paper prices reached a high of \$77.50 in May, which we have been viewing as the first-~~quarter~~-half high. Since then, prices have declined in what could be a weak flag formation on the charts, with successively lower highs and lower lows. We have been looking for prices to decline to the \$55 level as a “production low.” However, this will depend upon labor availability. In response to the August report, December print prices rallied, but did not ~~set~~ equal their prior high of \$1.50. If labor problems were to continue to threaten lumber mill activities, a rally to new highs would be possible. We think there is risk to the \$5.60 level in November paper products, if the \$5.38 level is penetrated. In that case, we would look for December paper to rally to the \$82 level, just above the old high of \$77.50. However, if ~~timely~~ negotiations are successful, prices could still set back to the \$55 level.

Comment [LP1]: Page: 1
Shouldn't this be first-half? May is in the first half, not the first quarter.
