

## Style Copyediting Service

*The first paragraph below is a sample of text submitted to our server for STYLE service. We edited it and came up with the changes identified in the second paragraph. The customer has the option of taking or leaving our suggestions. If the customer were to take all our suggestions, he would end up with the third paragraph.*

Ideally, such solutions would be available on an application service provider (ASP) basis as well as be offered as a combination of software and services, perhaps even tailored to specific industry and/or market out of tolerance conditions. In this manner, organizations could take advantage of these capabilities on a pay-as-you-go basis without incurring the capital cost of an extensive implementation. This might be attractive to the organization without extreme complexity in terms of business relationships or conditions/business rules that govern them, not to mention small to mid-sized organizations without the staff or budget to support large scale implementations.

*Our STYLE service would change this atrocious paragraph to be:*

Ideally, such solutions would be available on an application service provider (ASP) basis, ~~as well as be~~ and would be offered as a combination of software and services, perhaps even tailored to specific industry and/or market out-~~of-~~tolerance conditions. ~~In this manner, o~~ Organizations could take advantage of these capabilities ~~use these features~~ on a pay-as-you-go basis ~~s~~ without incurring the capital cost of an extensive implementation. ~~This might~~ These features would be attractive to ~~the organizations~~ not answerable to larger business entities, but could be a problem for organizations hindered by complex business relationships. Small to mid-sized organizations without the staff or budget to support large-scale implementations would find these features very helpful. ~~without extreme complexity in terms of business relationships or conditions/business rules that govern them, not to mention small to mid-sized organizations without the staff or budget to support large scale implementations.~~

*This then renders the finished paragraph to be:*

Ideally, such solutions would be available on an application service provider (ASP) basis, and would be offered as a combination of software and services, perhaps even tailored to specific industry and/or market out-of-tolerance conditions. Organizations could use these features on a pay-as-you-go basis without incurring the capital cost of an extensive implementation. These features would be attractive to organizations not answerable to larger business entities, but could be a problem for organizations hindered by complex business relationships. Small to mid-sized organizations without the staff or budget to support large-scale implementations would find these features very helpful.
