

TIPS TO PREVENT RANSOMWARE

Follow these tips to minimize your chances of a Ransomware attack or other forms of Malware from entering your systems and network

Back Up Regularly

Back up your data on a regular basis and keep a copy of this data offsite to minimize the damage if you are infected by Ransomware

Use Caution with Links and Attachments

Be careful with links in emails and attachments in emails that appear to be from a familiar source. When in doubt, don't open it to be on the safe side

Train, Test, Repeat

Your employees are your greatest asset and your weakest link in the Information Security chain. Train your employees on what to look for, test them in a controlled environment, and repeat this process regularly

Update Anti-Malware and Antivirus

Update your Anti-Malware and Antivirus software definitions on a regular basis and run scans on a regular basis to make it harder for Ransomware to enter your system
