

OUTLAST

Originally developed for NASA's space program, OUTLAST became one of the first "smart" technologies to revolutionize consumer textiles where extended comfort is important.

Outlast adapts to your skin's microclimate to buffer against overheating and sweating resulting in consistent and comfortable microclimate next to your skin. To help maintain your personal comfort zone, this technology buffers temperature swings by absorbing excess heat when you create too much and releasing it when you need it.

Extensive laboratory and field testing has demonstrated the ability of Outlast products to help you sleep better, reduce overheating, sweat less and avoid chill.
