

# A Single Source Solution Provider for All Your SD-WAN Service Needs

## Software Defined WAN

SD-WAN is becoming the mainstream choice for many organizations. Does using internet-facing circuits instead of private circuits sound intimidating? It shouldn't. Continuant partners with the world's leading SD-WAN providers, and can address concerns about security, redundancy, quality of experience, and more.

Your business requires a robust communications and data network for its mission critical applications and services. Traditionally that has been accomplished by connecting private sites with MPLS or other private circuits. SD-WAN provides solutions that not only meet or exceed those offered by traditional WAN technologies, but can provide additional capabilities, such as redundancy, application acceleration, dynamic bandwidth to large cloud providers, and more. Map and scale to your business objectives faster and more effectively, with SD-WAN.

## Why Choose SD-WAN?

- Best overall value and functionality
- Agility and speed when adding locations
- Redundancy, scalability and fault tolerance
- Quality of experience for critical applications
- Simplification of operations
- Connectivity to other cloud-based solutions
- Dynamic bandwidth
- Cost effective upgrades
- Support whenever you need it
- Application acceleration and optimization

## Why Continuant

- Continuant is independent and provides multiple options designed to fit your business needs.
- We become an integrated part of your organization's ecosystem.

## Continuant's Role

- Learn your business structure and goals
- Understand your IT infrastructure
- Determine the optimal SD-WAN solution
- Source the optimal supplier
- Implement and support the selected solution
- Handle all customer service and escalations

### BANDWIDTH AGGREGATION

SD-WAN utilizes multiple Internet circuits, balances the load across all circuits, and deliver a solid quality of experience. Aggregating the internet circuits allows for large amounts of bandwidth, while securely connecting to additional private locations. Multiple sites can be added in short order once internet access is acquired.

### REDUNDANCY

SD-WAN solutions can combine your MPLS and Internet connections, so they don't sit idle.

### DYNAMIC BANDWIDTH

Do you utilize or plan to utilize other cloud services, such as AWS, Azure or Google? Many SD-WAN providers connect directly to cloud providers. Bandwidth can increase dynamically as your cloud needs change.

### QUALITY OF EXPERIENCE

SD-WAN solutions can provide prioritization to the mission-critical applications your business demands. Typically, providers choose the best circuit based on real-time statistics giving priority to video, voice, and other business applications. SD-WAN solutions accelerate applications, optimize traffic, and reduce overall latency, jitter and response times.

### NETWORK FUNCTION VIRTUALIZATION (NFV)

We partner with companies that virtualize network functions, such as firewalls, VPNs, load balancing, application acceleration, and more.

### SECURITY

SD-WAN provides secure connections between sites and reduced complexities when transmitting sensitive data.

## About Continuant

Continuant is an independent provider of global unified communications managed services solutions for the enterprise, with an unsurpassed record of extraordinary customer service. Continuant is committed to achieving its customers' business communications objectives, including providing maintenance and support for legacy systems, managing complex unified communications infrastructures, and offering global Unified Communications as a Service (UCaaS). Continuant provides service plans that deliver proven results along with an outstanding customer experience.
