

VERSPRITE

Digital Forensics & Incident Response

– Identification, Response, Recovery

We use our expertise to implement a practical strategy to minimize the impact of incidents through pre-incident preparation, prevention strategy, and incident management. Along with traditional incident response and digital forensics services, we provide intrusion/compromise assessment, threat hunting, and an independent perspective of the protections in your environment. We also leverage our techniques to support merger and acquisition due diligence efforts.

Digital Forensics

VerSprite's DFIR team has experience with compromise assessments and threat hunting that helps identify and remediate unwanted activity that may be occurring on your systems and network. Our collection and analysis results in a thorough, actionable report that characterizes the threat or compromise and builds a strategic plan to quarantine and eradicate threats. Want something custom tailored to assess your processes, procedures, your IT, or security teams? We develop and facilitate tabletop exercises designed to assess your capabilities against many types of threats.

Incident Response

Our overarching goal is to provide a cohesive, informed response when the inevitable happens. We partner with clients to quickly scope and contain various incidents, and then focus efforts to helping them restore normal business operations. Whether it relates to insider-based threats (e.g. – sabotage, intellectual property theft), extortion by cybercriminals, or being the unsuspecting victim to propagating malware variants from internet sources, we're here to help and ready to respond in order that you can resume business within trusted computing domains.
