

Cloud versus On-Premise ERP: Which is Right for Your Business?

The decision to move business and financial management applications to the cloud can't be made lightly. By carefully weighing the pros and cons, you can make the right choices for your organization.

Security

Cloud ERP providers are required to maintain high levels of data protection and backup.

On premise servers give control to your IT team or MSP (Managed Service Provider), but means they must stay ahead of security threats to protect corporate and customer data.

Performance

Vendors are held to high standards of availability and performance, defined in service level agreements.

Internal IT team is responsible for updating technology and improving performance issues.

Business Continuity

Redundant facilities mitigate risk of regional disasters, so operations can continue even if offices are closed.

Implementations

Shorter implementation time without complicated software and hardware installations.

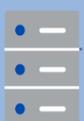

More control over customizations and integration with on-premise software implementations.

Cost

Cloud ERP, requiring no capital investment in hardware, means lower upfront costs.

On-premise ERP allows you to make the most of your current investment in infrastructure.

Customizations

Continuous updates from Cloud ERP providers usually mean fewer customizations.

On-premise software can support as many customizations and integrations as desired.

Day to Day Operations

Cloud ERP provides users with the latest capabilities for productivity and mobility, delivering data to employees wherever they work.

On-premise ERP stores data in the office, keeping employees onsite and engaged with coworkers.

Strategic Advantage

Cloud opens the door to digital transformation so you can take advantage of capabilities like artificial intelligence, machine learning and IoT (Internet of Things).

On-premise ERP can help you comply with government regulations determining how you use and store sensitive data.
