

# Bespoke Ceilings

## Taking beauty to a whole new level

DIRTT's Bespoke Ceilings provide endless possibilities to create overhead geometric designs and add superior acoustics to any space. Available in Teck grain veneer or Thermofoil finishes, our custom-built ceiling solutions are manufactured to your specifications and arrive onsite ready for installation in five weeks or less.

## Beauty can be this easy

Installed in a non-progressive way, our Bespoke Ceilings are designed to look, perform and respond exactly how you envisioned. Lighting, HVAC, sprinklers and any technology fixtures can be fully integrated so they don't affect the look and flow of your space. When you need to upgrade or replace parts of your Mechanical, Electrical and Plumbing (MEP) systems, our ceiling tiles can be easily removed for future above grid access— making inspections and repairs safe and fast.

# How DIRTT Bespoke Ceilings are installed

## Step 1

Our Bespoke Ceiling solutions use a custom sub-frame that is attached below the T-bar grid. This sub-frame is used to locate and attach the ceiling tiles. Shop drawings are provided before install to show grid location so there is no interference with MEP components and the T-bar, these drawings directly reflect the projects' custom Bespoke ceiling design and reflective ceiling plan.

## Step 2

The finished Bespoke Ceiling tiles are snapped into place using a ball stud and receiver connection allowing for quick install and removal as well as accurate tile alignment. It is recommended to install all tiles with any MEP components first, to allow other trades to install the components.

## Step 3

Once all tiles and MEP components are installed, the remaining Bespoke Ceiling tiles can be snapped into place.
