SUBJECT: End of Life Decisions and Care

OBJECTIVE: To establish processes for patients and their families facing life-threatening illness including caring for the dying and supporting the bereaving.

Policy: Pullman Regional Hospital will respect and participate in each individual patient's end of life decisions including palliative care and /or requests for life ending measure followed in compliance with the Washington Death with Dignity Act / Initiative 1000.

Definition:

- **Hospice Care:** Service delivery system that provides care for patients who have six months or less to live. It supports patients through the dying process and the surviving family through the dying and bereavement processes.
- Palliative Care: "Is an approach to care which improves quality of life of patients and their families facing life threatening illness, through the prevention, assessment and treatment of pain and other physical, psychological and spiritual problems." World Health Organization Focus of palliative care is relieving suffering and enhancing quality of life as follows:
 - I. Providing effective pain and symptom management
 - II. Addressing psychosocial and spiritual needs of the patient and family
 - III. Incorporating cultural values and attitudes into the plan of care
 - IV. Supporting those who are experiencing loss, grief, and bereavement
 - V. Promoting ethical and legal decision-making
 - VI. Advocating for personal wishes and preferences
 - VII. Using therapeutic communication skills
 - VIII. Facilitating collaborative practice

Washington Death with Dignity Act / Initiative 1000:

Allows competent, terminally ill adults seeking to end their life to request lethal doses of medication from medical and osteopathic physicians. To receive life-ending medication a person must meet the following criteria:

- I. A Washington resident
- II. A competent adult (18 years or older)
- III. Is diagnosed with a terminal illness
- IV. Is medically predicted to die within six months; and ,
- V. Is able to take the medication by him or herself, without help

Quality of Life Team (QOL):

A hospital interdisciplinary team available as a consulting body for education, review, and guidance for patient's whose care goals have shifted from cure to comfort when identified as a need by any healthcare team member, patient or family member. The team will also be involved with hospitalized patients who have decided to take life ending medication in accordance to the law.

Process for Utilization:

Hospice Care:

Hospice consults can be referred by Social Services as requested.

Palliative Care:

Palliative care can be started at any time by any physician when appropriate. It does not inhibit care but instead increases options for comfort.

Initiative 1000 Utilization: See Board of Commissioner's policy I-1 "Initiative I-1000".

Quality of Life Team (QOL) Utilization:

- 1. The QOL team will consist of members from Nursing, Social Services, Respiratory Therapy, Speech Therapy (swallow issues), Pharmacy and Physician Services, chaplains, Utilization Review nurse and behavior health involvement as necessary for individual cases.
- 2. If a healthcare team member feels a patients' comfort level is not at goal, the family could benefit with assistance from the QOL team or a pharmacy consult. A quality-of-life call can be initiated through Meditech. If more urgent concerns arise, the following persons are also available on-call:

509-432-3465
208-305-7030
509-432-1728 (or Pharmacist on call: ##91)
509-595-5986

- 3. The QOL team will meet with the referring individual to hear concerns / issues and possible needs. The team will then review the chart and orders and will make decisions on next steps for each individual case using the palliative care approach and involving other team members as necessary.
- 4. The Ethics Committee will be convened for recommendations and consultation as needed.
- 5. Documentation of the consult will be made in patient notes, titled QOL consult.
- 6. The team will then follow-up and monitor the patient's care until discharge.

Appendix A:

Instructions and Guidelines for End-of-Life Order:

- 1. Prior to initiating End-of-Life orders, the following should be completed:
 - DNR orders
 - Family conference: Document rationale for End-of-Life and discussion with patient and / or family / surrogate decision maker. Family member / surrogate decision maker must be named and relationship noted within progress note. If a patient does not have family or a designated decision maker, note that situation in progress note.

2. GOAL of treatment:

End-of-Life orders are intended for use in end of life care when decisions have been made to withhold or withdraw life-sustaining treatment and not to resuscitate. End-of-Life continues to be an active treatment plan with an obligation to provide medical care designed to relieve pain or discomfort. It is not implemented to hasten death. The goals of End-of-Life are to optimize comfort and dignity by providing care that is respectful, involves the patient and family, has appropriate treatment for primary and secondary symptoms as desired by the patient or surrogate decision to maker, manages pain aggressively, responds to psychological, social, emotional, and spiritual concerns of the patient and family, sensitively addressed end of life issues such as autopsy and organ donation, and is culturally relevant.

Prior to implementation, each intervention should be assessed in the following areas:

- What is the goal of the intervention?
- Does the intervention agree with the patient and/or families wishes?
- Does the intervention enhance the patient's quality of life and provide comfort?
- Has the patient and/or family been informed as to the risks and benefits of the interventions?
- 3. Palliative Prognostic Score: http://palliative.info/teaching_material/Prognosis.pdf
- 4. End-of-Life orders can be entered into the computer as soon as appropriate as the patient's situation changes and decisions are made by the patient and family.
- 5. If it becomes apparent that a patient may pass here in the hospital, an end-of-life care bag with literature and a blanket should be offered to the patient and their family when appropriate.
- 6. Food trays may be offered to the family when appropriate.
- 7. It may be necessary to have more than one conference as the patient's clinical situation changes, to ensure the patient and family goals are being met.
- 8. Clinical conversations should be had directly with the power-of-attorney and patient when at all possible.

9. If a patient's comfort level is ever "uncontrolled" and the primary physician cannot be reached or the goals have not been met, please call the Quality of Life Team or the Pharmacist on call as appropriate to the situation for assistance in finding an appropriate treatment for comfort.

Patient Care # E-5 Revised: 1/15 RLH:bmc

Ventilator Withdrawal Guidelines

Preparation:

- 1. **Family Meeting:** Review decision to withdraw life-sustaining treatment
 - If the patient is conscious, what are his or her desires about the procedure?
 - Does the family want to be present for the withdrawal?
 - Do they want to see the patient after death?
 - Consider special readings, rituals, prayers, or music before, during or after withdrawal of the vent.
 - Advise the family on the possibility of prolonged survival after withdrawal of vent.
 - Consider discussing in advance decisions that will be faced after death, such as tissue, organ, or body donation, autopsy, and funeral arrangements.
 - Establish a time for withdrawal with the family and appropriate staff can be present.
- 2. **Clinical Team Meeting**: include physician, primary nurse, quality of life member, respiratory therapist, chaplain, social services, pharmacy, clinical coordinator.
 - Review current life sustaining treatments and which should be withdrawn discontinue all previous
 orders including routine vitals, medications, enteral feeding, IV drips, radiographs, lab tests,
 whatever is causing the patient discomfort (i.e., turning); remove devices from patient and the room.
- 3. **Symptom Management** enter orders for management of distressing symptoms and signs, such as agitation, air hunger, and noisy secretions (see End-of-Life and withdrawing life sustaining treatment order sets)

Withdrawal Procedure:

1. Create Peaceful Surroundings

- Remove unnecessary equipment, creating bedside space for the family.
- Provide tissues and comfortable chairs.
- Remove mitts and poseys, lower bedrails, and set bed height to facilitate family-patient touching or handholding.
- Discontinue monitors and alarms in the room, including but not limited to: oximeters, vital sign monitor, ECG recording, unneeded pumps, and respirator alarms.
- Discontinue inappropriate television or radio distractions.

2. Gather Family

- If they stay in the room, review the process of what they might see
- Allow time for any rituals and for saying a final goodbye
- Address particular needs of young children
- Social worker, nurse, or chaplain may stay with the family by the bedside or in the waiting room
- Check family perception of the level of patient comfort, and address appropriately to incorporate their wishes about sedation and analgesia.

3. Determine if premedication is necessary:

- if the patient is capable of experiencing distress or if distress is likely during the withdrawal procedure, continue current analgesia and sedation regimen, and *premedicate with opioids and benzodiazepine* via bolus or infusion.
- Even if the patient appears comfortable when undisturbed, *anticipatory dosing* is appropriate if he or she has shown signs of distress during nursing or respiratory care interventions. For example, a comfortable appearing patient may have experienced grimacing or distress with prior suctions, repositioning, or reduction in ventilator support, and would be expected to experience

distress with withdrawal of ventilatory support.

4. During the withdrawal process, use suctioning as needed, monitor the patient's comfort frequently, and titrate medications for any signs of distress, such as tachypnea, labored breathing, accessory muscle use, nasal flaring, tachycardia, hypertension, diaphoresis, grimacing, restlessness, and excess or noisy secretions. The combination of an opioid plus benzodiazepine is indicated because narcotics provide relief of dyspnea and pain, while suppressing cough, whereas benzodiazepines provide sedation, and anxiolysis. Benzodiazepines also offer anticonvulsant effects that may protect from hypoxemia-related seizures. Fentanyl is often preferred due to staff familiarity with the drug, while morphine is more likely to lead to toxicity (typically myoclonus) at high doses, especially with renal failure.

Ventilator Withdrawal:

- 1. Assure discontinuance of neuromuscular blockade (which would mask distress).
- 2. Is pre-sedation necessary? Target SAS < 2 (deep sedation).
- 3. Different methods of discontinuation: may be chosen on the basis of patient's clinic condition and family's preference:
 - Rapid Reduction dialing down the ventilator settings stepwise for Fi02, PEEP, respiratory rate and volume or pressure every few minutes, watching for distress or
 - Immediate Cessation of ventilator support immediate discontinuation of mechanical ventilation
 - Endotracheal tube immediate or eventual extubation. Removal of the ET tube can be associated with severe coughing and messy secretions, but the tube can be a source of distress in conscious patients and prevent talking, while the ventilator may hinder family from gathering around the bed and touching the patient. Maintaining the airway protects against stridor and difficulty with copious secretions, especially when the patient lacks adequate gag or cough reflex.
 - If the patient experiences discomfort during any of the following reductions in ventilation, resume higher settings and adjust the medication for comfort prior to further ventilator changes.
 - Reduce alarm settings to minimal settings or, if possible, turn them off
 - Over 0-5 minutes, reduce FiO2 to room air and PEEP to zero.
 - You may want to wait a while at this point, expecting the patient to expire, or you can proceed over 0-15 minutes to reduce the respiratory rate and tidal volume or target pressure on the ventilator to zero.
 - Concerning the airway:
 - Extubate patient to room air, wrapping the ET tube (which may be messy) in a towel, or
 - Remove connection to the ventilator, keeping the ETT or tracheostomy in place.
 - If tracheal secretions are bothersome, an in-line suction catheter can be attached to the ETT without supplemental O2 or humidity.
 - Note the time of death, when it occurs.

After the Death

- Allow family and staff to be with patient
- Allow family to help with postmortem care, if they choose so.
- Assess family member's state of grief and ability to travel.
- Notify involved staff and allow time for health care team to debrief.

Notes on Discussing Withdrawal with Patient and / or Family

- 1. Describe the process. Use simple language and allow for questions
- 2. Pause periodically and leave time to listen to family members' concerns and / or reminiscences

- 3. Assure them that achieving comfort is the goal and can be managed
- 4. Determine in advance a reasonable level of sedation desired by the patient and family (conscious but calm, light sleep, heavily sedated).
- 5. Explain that breathing changes will occur, but that breathlessness can be alleviated. If the patient is capable of feeling discomfort, medications will be given to avoid the sensations of breathlessness, pain and / or anxiety
- 6. If a well-sedated or comatose patient shows gasping, twitching or other involuntary movements, reassure the family that such actions do not reflect conscious suffering
- 7. Encourage the family to engage in cultural or spiritual practices befitting of the patient's life and traditions.
- Caution the family that, while death is expected, the timing of it is uncertain.
 "After life support machines are withdrawn, we will watch and wait as we continue to focus on comfort while letting nature take its course."
