- Properties of  $\text{SmCo}_5$  and  $\text{Sm}_2\text{TM}_{17}$  magnets
- Temperature compensated magnets
- High temperature magnets
- Microstructure and thermal stability
- Applications

# Sintered Sm-Co Magnets (Overview)

TC: temperature compensated

# Typical Manufacturing Process for Sintered Sm-Co Magnets

# Outline

- Sm-Co magnets overview
- Properties of  $\text{SmCo}_5$  and  $\text{Sm}_2\text{TM}_{17}$  magnets
- Temperature compensated magnets
- High temperature magnets
- Microstructure and thermal stability
- Applications

# Properties of SmCo<sub>5</sub> Magnet

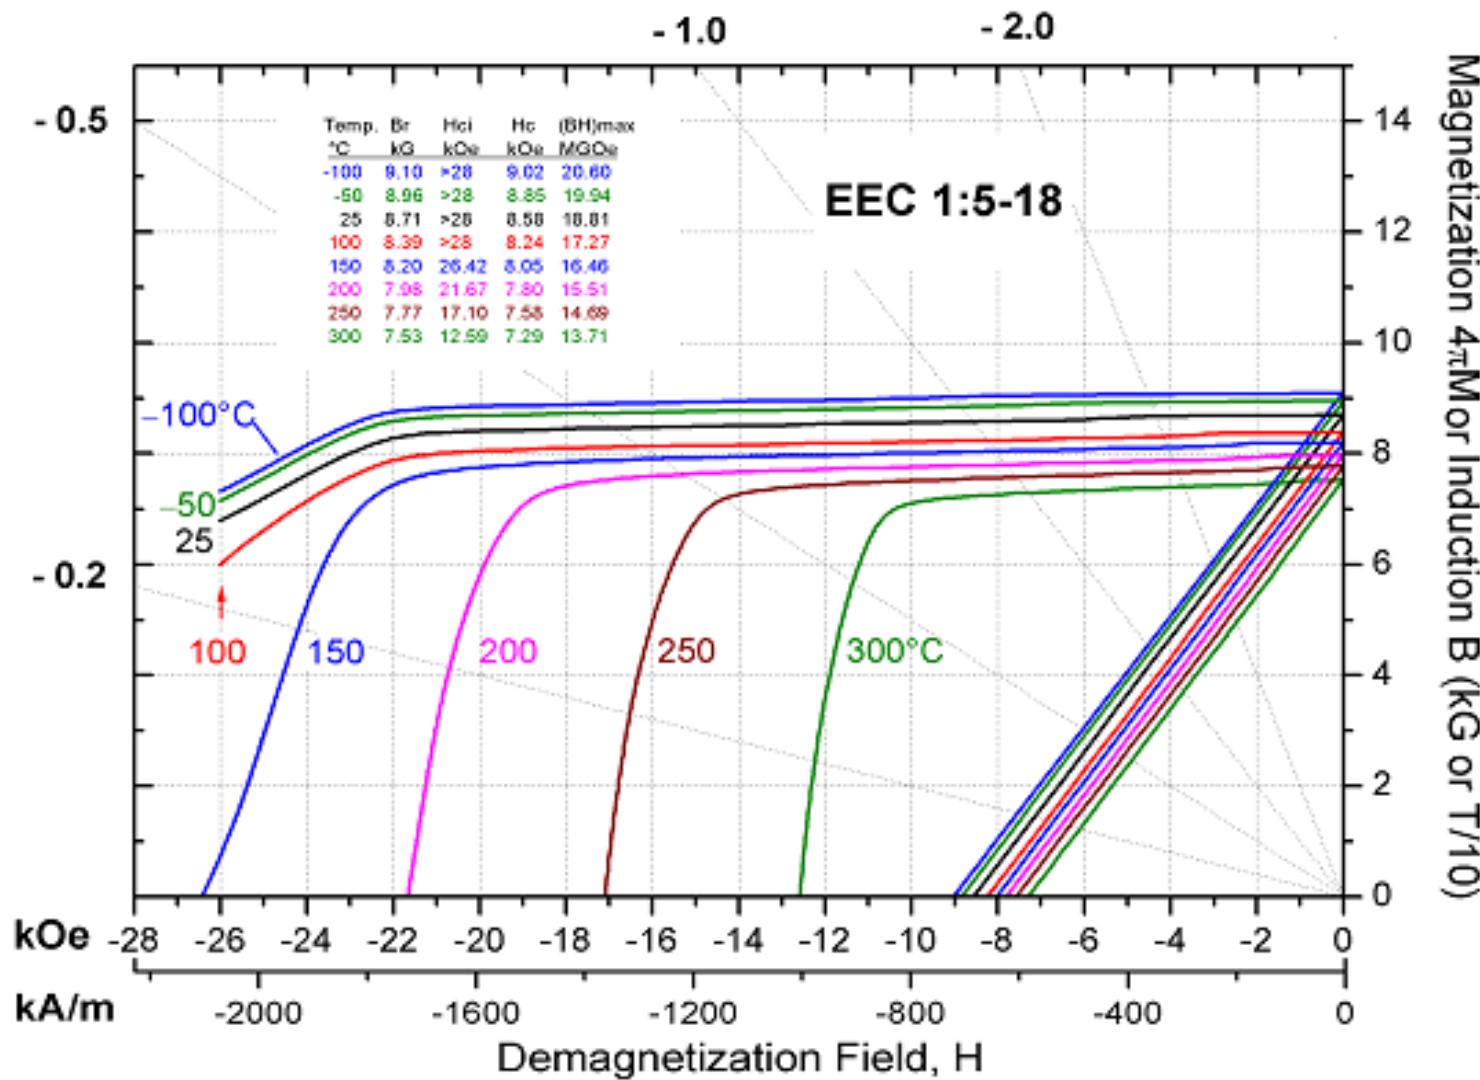

## Typical properties:

- $B_r = 8750$  to 9000 G
- $H_c = 8.5$  to 8.8 kOe
- $H_{ci} > 30$  kOe (It could be as high as 50 kOe)
- $(BH)_{max} = 18$  to 20 MGOe

## Advantages:

- Maximum operating temperature up to 300°C
- High resistance to demagnetization
- Superior corrosion resistance

# Demagnetization Curves of SmCo<sub>5</sub> Magnet

## Why we call it SmCo 2:17?

- It is a evolution from the  $\text{Sm}_2\text{Co}_{17}$  phase
- $\text{Sm}_2\text{Co}_{17}$  can also be written as  $\text{SmCo}_{8.5}$
- Other transition metals (Fe,Cu,Zr) are added for the development of optimum magnetic properties
- Then we have  $\text{Sm}(\text{Co}_{(1-u-v-w)}\text{Fe}_u\text{Cu}_v\text{Zr}_w)_{8.5}$
- Extra Sm added to compensate oxygen pick-up in the process, so we change the formula to the following:

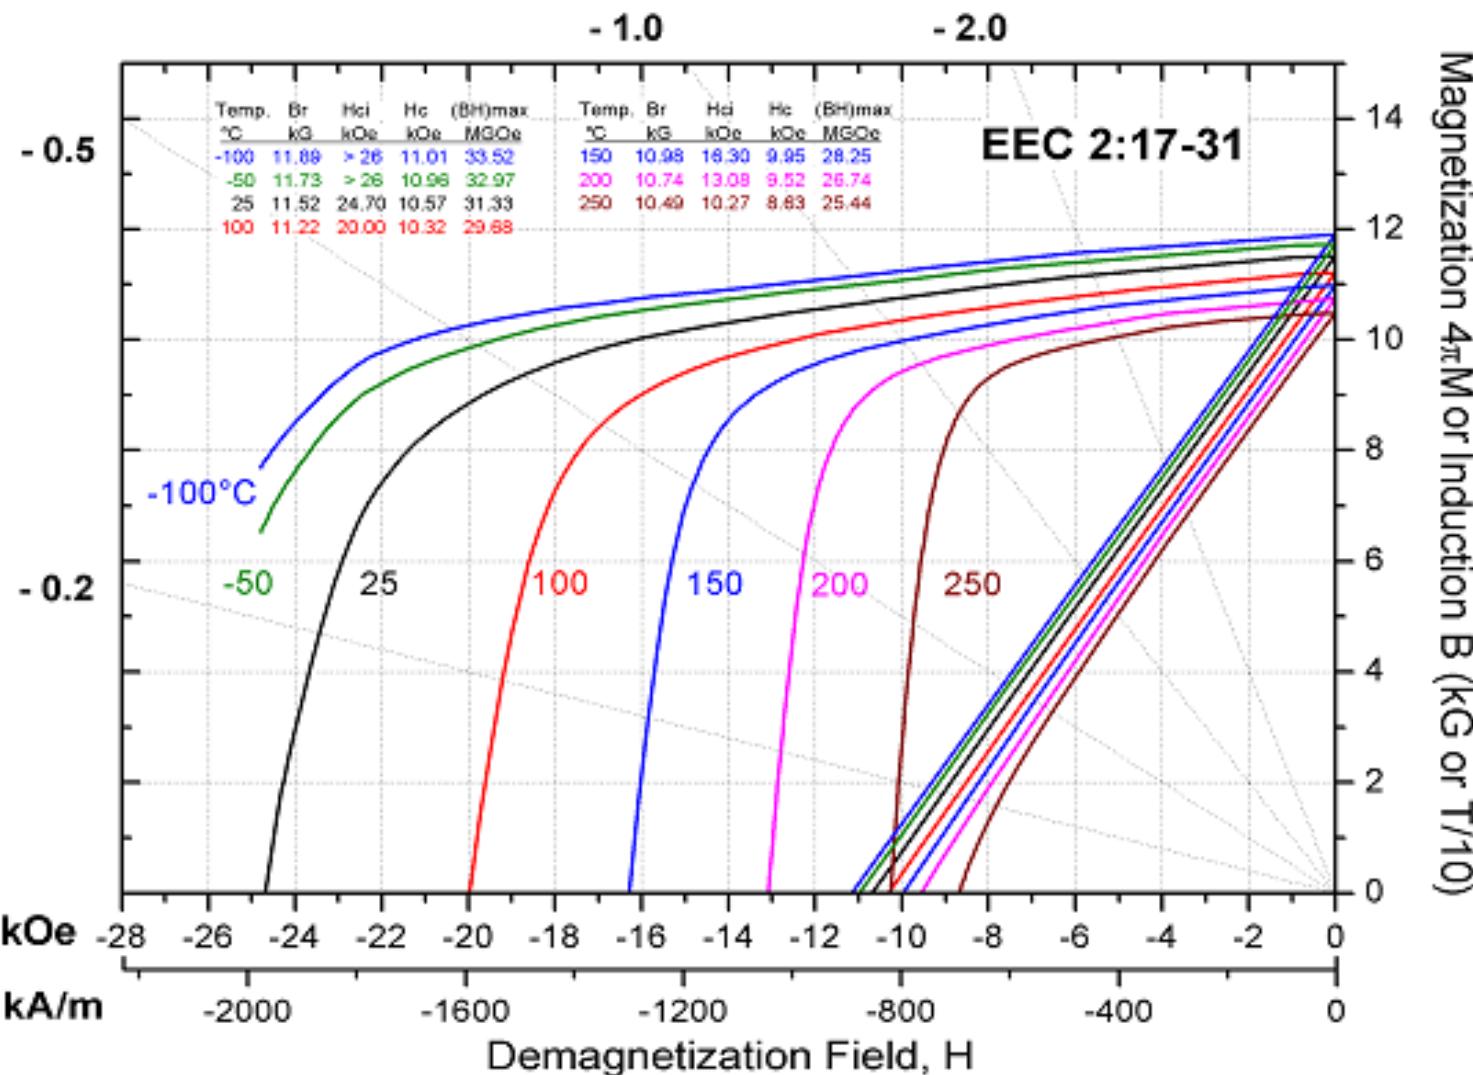

# Properties of SmCo 2:17 magnets

- Maximum energy product,  $(BH)_{\max}$ , to 32 MGoe
- Residual induction,  $B_r$ , to 11,600 Gauss
- Coercive force,  $H_c$ , to 10.6 kOe
- Intrinsic coercive force,  $H_{ci}$ , > 25 kOe
- Maximum operating temperature,  $T_M$ , from 250°C to 550°C

# High Energy SmCo 2:17 magnets

# Outline

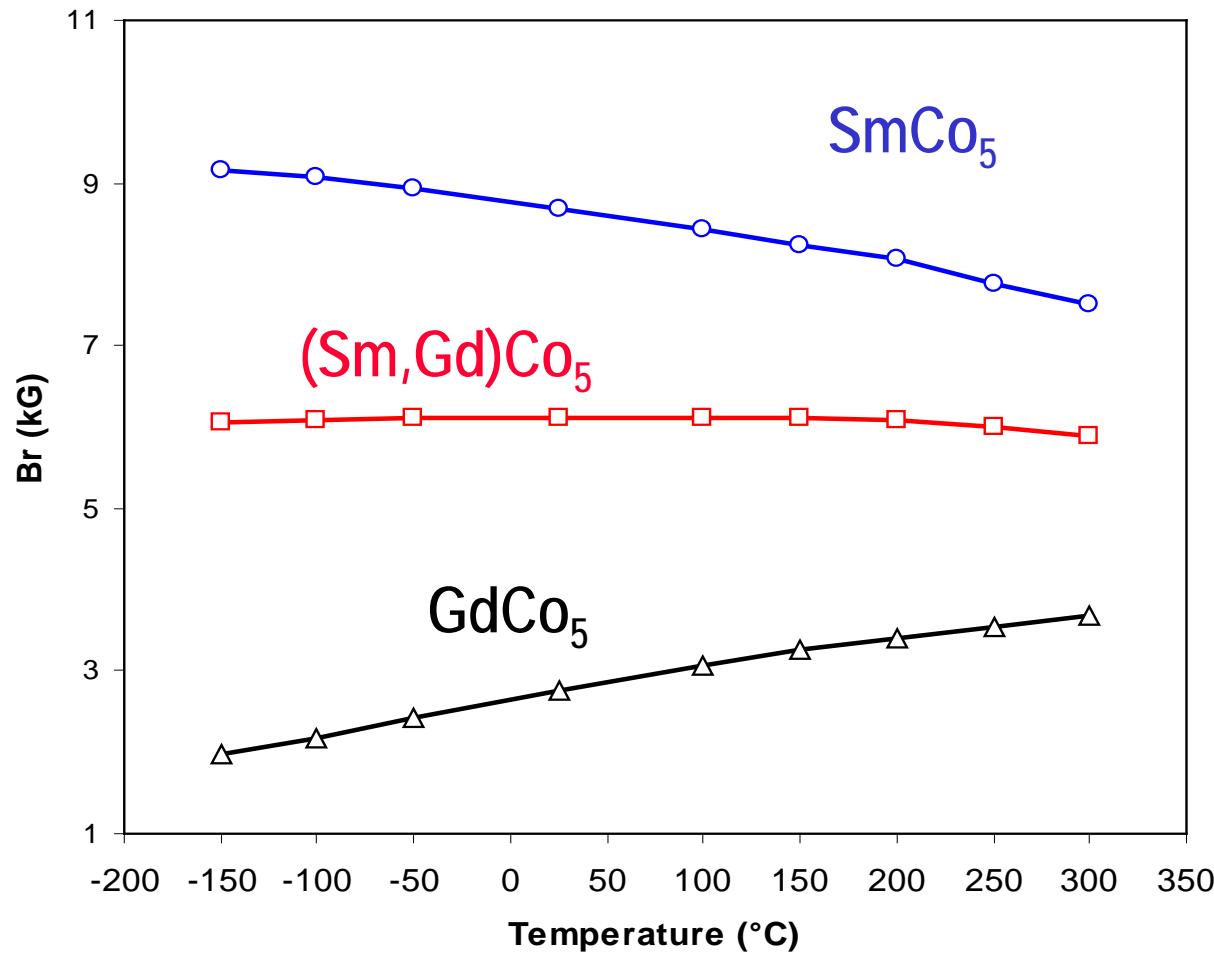

- Sm-Co magnets overview
- Properties of  $\text{SmCo}_5$  and  $\text{Sm}_2\text{TM}_{17}$  magnets
- Temperature compensated magnets
- High temperature magnets
- Microstructure and thermal stability
- Applications

- $B_r$  changes with temperature
- Some applications , such as gyro and TWTSs, require stable  $B_r$  over a wide temperature range
- The reversible temperature coefficient of  $B_r$  is defined as:

$$\alpha = \frac{\Delta B_r}{B_r} \cdot \frac{1}{\Delta T} \times 100\%$$

- To address above requirements, EEC developed temperature compensated magnets with the reversible temperature coefficient of  $B_r$  close to zero

# Temperature compensation for RE-Co 1:5 magnets

# Temperature compensated RE-Co 1:5 magnets

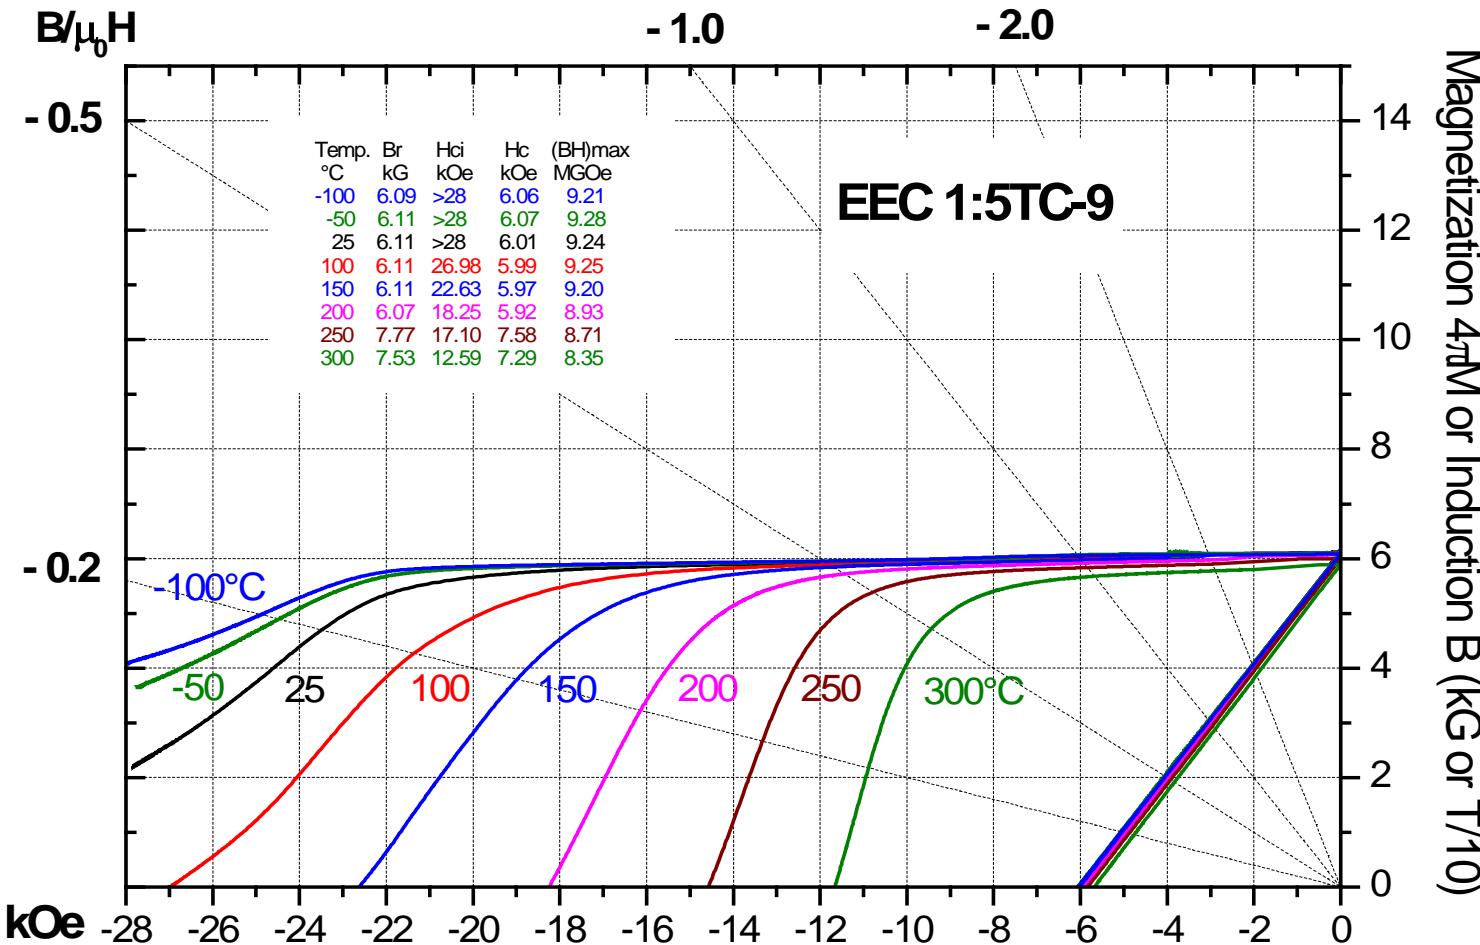

Grades	$(BH)_{\max}$	RTC* of $B_r$	Comment
EEC 1:5-18	18 MGOe	-0.04 %/°C	no compensation
EEC 1:5TC-15	15 MGOe	-0.03 %/°C	some compensation
EEC 1:5TC-13	13 MGOe	-0.02 %/°C	some compensation
EEC 1:5TC-9	9 MGOe	-0.001 %/°C	full compensation

\*RTC: Reversible temperature coefficient

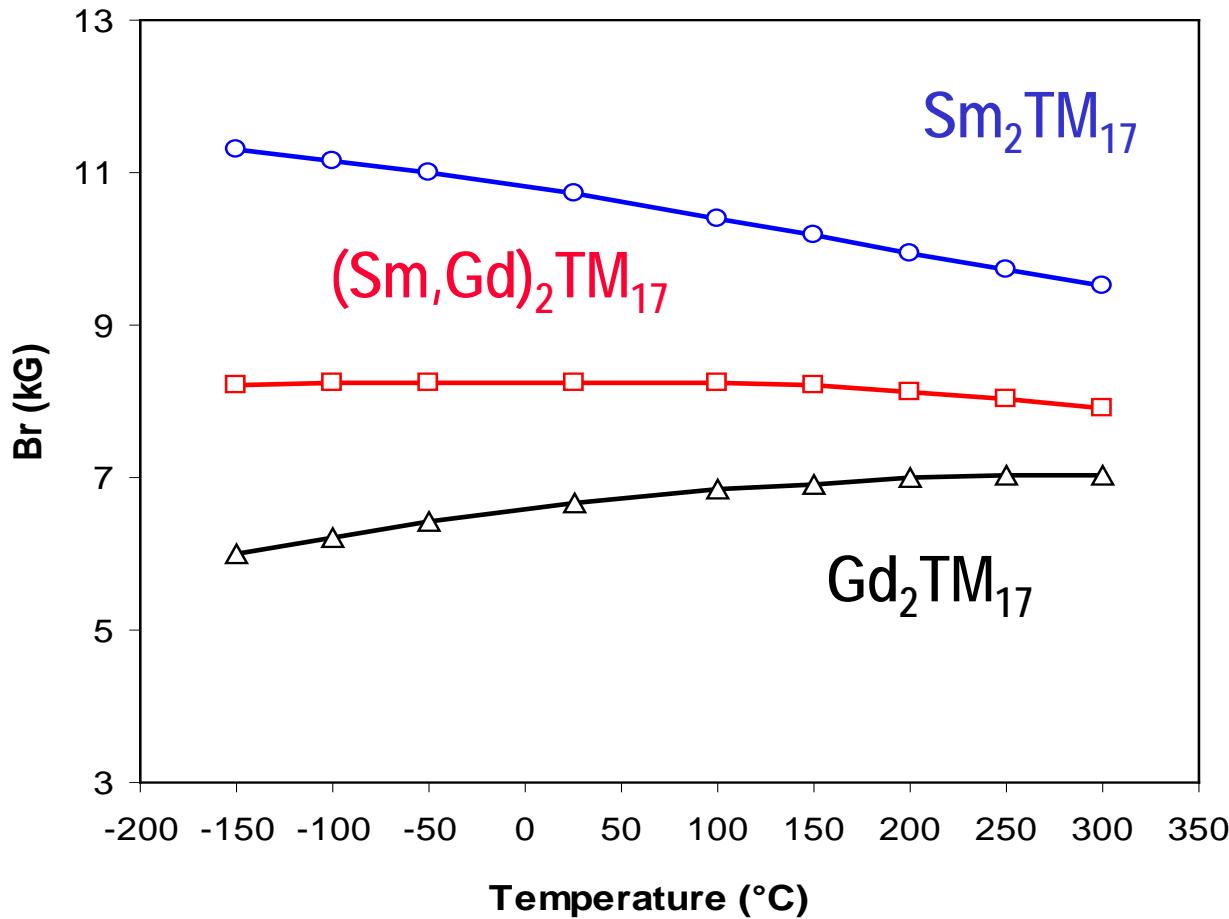

- Reversible temperature coefficient of  $B_r$  of fully compensated SmGdCo 1:5 magnets is 40 times smaller than the non-compensated  $\text{SmCo}_5$  magnets
- The  $(BH)_{\max}$  decreases for the temperature compensated magnets due to the low saturation magnetization of  $\text{GdCo}_5$

# RETM<sub>5</sub> type 0TC material

EEC®

# Temperature compensation for $\text{Sm}_2\text{TM}_{17}$ magnets

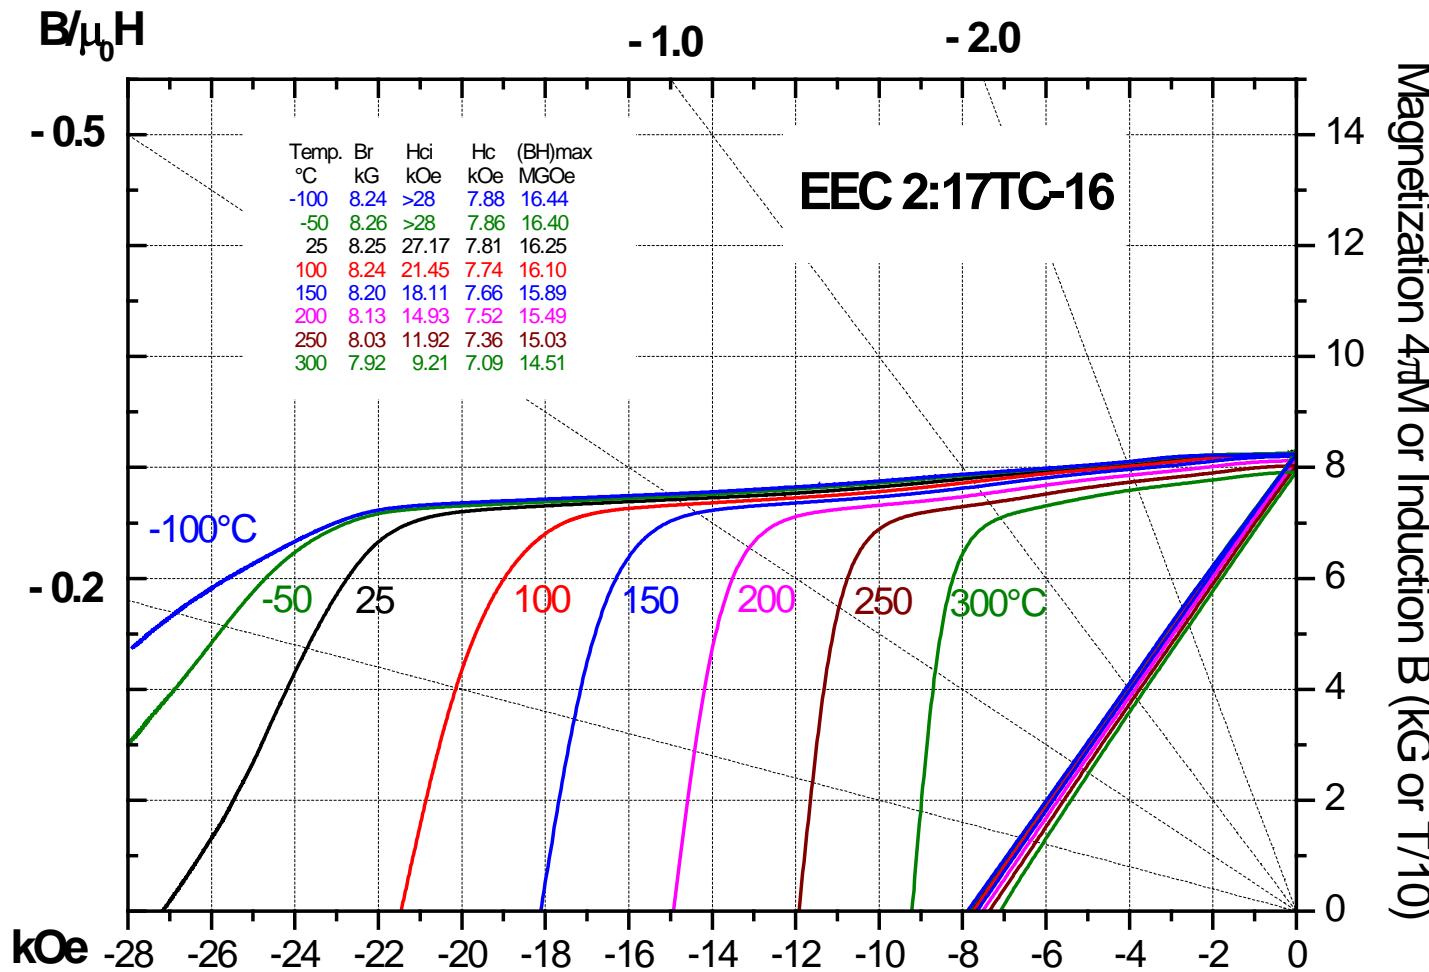

## Temperature compensated Sm-Co 2:17 magnets

Grades	$(BH)_{max}$	RTC* of $B_r$	Comment
EEC 2:17-24	24 MGOe	-0.035 %/ $^{\circ}$ C	No compensation
EEC2:17TC-18	18 MGOe	-0.02 %/ $^{\circ}$ C	Some compensation
EEC2:17TC-16	16 MGOe	-0.001 %/ $^{\circ}$ C	Full compensation

\*RTC: Reversible temperature coefficient

RTC of  $B_r$  is calculated within the temperature range -50 to +150 $^{\circ}$ C

# Outline

- Sm-Co magnets overview
- Properties of  $\text{SmCo}_5$  and  $\text{Sm}_2\text{TM}_{17}$  magnets
- Temperature compensated magnets
- High temperature magnets
- Microstructure and thermal stability
- Applications

- A few years ago, the maximum operating temperature of SmCo magnets was only up to 300°C
- DoD initiated the More Electric Aircraft program, which requires magnets with maximum operating temperature more than 400°C
- Funded by Department of Defense, we developed a series of sintered SmCo 2:17 magnets with maximum operating temperature as high as 550°C

# Demagnetization Curves for High Temp. Magnets

## Comparison of maximum operating temperature

# Important Features of High Temperature Magnets

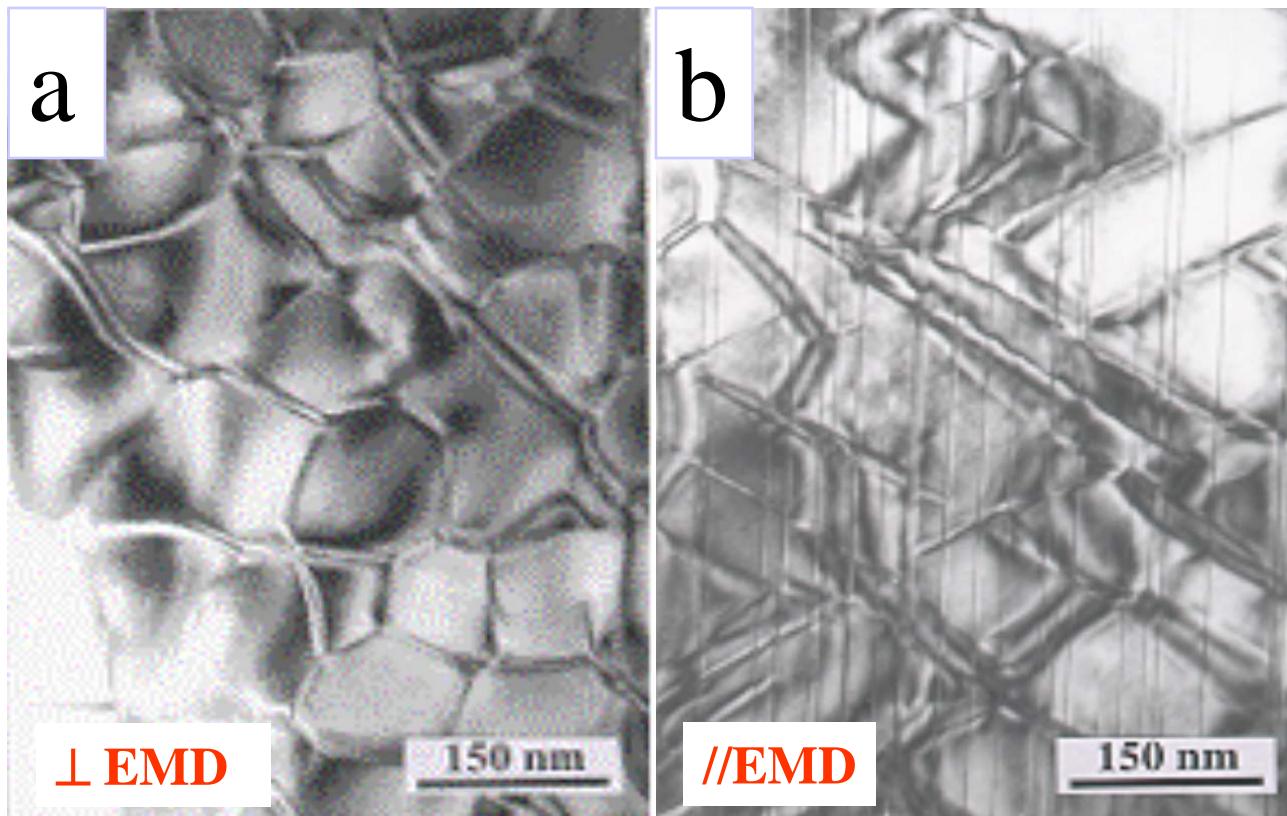

- ✓ High intrinsic coercivity  $H_{ci}$  at elevated temperatures to resist demagnetization
- ✓ Low temperature coefficient of  $H_{ci}$
- ✓ Straight-line demagnetization curves *at* maximum operating temperatures
- ✓ The maximum use temperature is defined as  $T_M$ , at which a straight line demagnetization curve can exist.
- ✓ Magnets can be made for any specified  $T_M$  up to 550°C with highest possible  $(BH)_{max}$
- ✓ High temperature magnets require surface coating (such as Ni-plating) if used above 400°C continuously.
- ✓ High temperature magnets still belong to  $\text{Sm}_2\text{TM}_{17}$  type magnet family.
