Re: New FiberTite® Drain Flashing Construction Details

## New FiberTite Drain Flashing Construction Details

2018.004 - Page One of One:

FiberTite Roofing Systems has added three (3) options for Drain Flashing Details to include the use of FiberTite Roofing Membranes.

The new Drain Details are:

1. FTR-DD3 - Typical Drain Flashing - w/ Fleeceback Membrane
2. FTR-DD4 - Typical Reinforced Drain Flashing
3. FTR-DD5 - Minimal Slope Drain Flashing

Drain Detail Drawings FTR-DD3 and FTR-DD4 illustrate typical sumped drains. The FiberTite membrane should be cut to fit the sump area, *and not stretched in place.*

Drain Detail Drawing FTR-DD5 illustrates a typical non-sumped drain, and does not utilize an individual drain flashing target. As shown on the Detail Drawing, *fasteners are required around the drain area.*

The use of FiberTite 60-mil non-reinforced flashing membrane remains a standard option for drain detail flashing.

These three (3) new Drain Details Drawings can be found at [FiberTite.com](http://FiberTite.com), in the *Construction Details section of the Document Library*. The drawings are found under *Penetrations*.
