

7 Things to Remember About Baselines

1

Baselines provide a snapshot of a “known-good” configuration of cloud infrastructure

2

You get a complete picture of a cloud environment with every resource and all its attributes

3

They serve as a “contract” to align security and DevOps teams on cloud compliance

4

Infrastructure as code only provides an incomplete picture of what will run in your environment – baselines tell you what is actually there

5

Organizations can get started with baselining in as little as 10 minutes by scanning what they already have

6

Baselines provide the necessary context for safe codeless auto-remediation

7

DevOps can use automated tools to scan for policy violations as part of baselining
