Much has been written about the need to transform to a digital workplace. The once-prized independent contributor has given way to what CEB calls the enterprise contributor. These workers thrive in a more connected and collaborative work environment. For most Facilities Managers, digital workplace initiatives that support this work style are on the radar if not the roadmap.

Digital workplace transformation is broad in scope and ambitious in its objectives. Though details vary, most digital workplace initiatives seek to increase employee engagement, support the changing nature of work, and align workplace technology with business objectives. This article will address a specific aspect of workplace transformation: creating connected workplaces. A connected workplace is a collaborative environment that enables fast communication, information-sharing in real-time, and the ability to quickly work together to solve day-to-day business challenges.

We recently partnered with IDG Networks to better understand how companies are creating a connected and collaborative workplace. This article will share the survey results and offer insights into what you can expect from your own initiative.

Top Use Cases Driving Business Leaders to Consider Connected Workplace Initiatives

Part of the changing nature of work is the number of people we must collaborate with on a daily basis just to get our work done. CEB found that 60 percent of us work with 10 or more people daily, and 63 percent of us regularly interact with people at different locations. With collaboration so integral to work, it’s not surprising that the primary reason for pursuing a connected workplace is to improve employees’ ability to quickly collaborate with remote colleagues.

Creating an environment that enables employee engagement and increases satisfaction is high on the priority list for facilities managers because of the strong correlation between engaged, connected workers and financial gains for the company. CEB research has found that companies that develop enterprise contributors have “twice the impact on financial outcomes.” Despite the importance of creating and enabling highly collaborative workers, CEB notes that only 17 percent of employees today are enterprise contributors.

The AVI-SPL/IDG study echoes that finding as only 16 percent of companies with 250-999 employees believed they had mastered the connected workplace. That percentage jumped to 41 in companies with more than 1,000 employees. For many of the rest, moving from the radar to the roadmap is a critical next step.

The High Cost of Workspace and Employee Disconnect

In addition to enabling collaboration with remote employees, vendors, clients, connected workplace initiatives yield critically important benefits to those who plan and manage workspaces. Currently, employee dissatisfaction with their workspaces, which include desktop, meeting rooms, and flexible spaces, is too high. Forty-five percent of employees do not have access to the right workspace at the right time. This failure causes employees to spend 27 hours each year looking for the best space to work—costing the average company $31 million in productivity annually. On the flip side, employees who are happy with their workspaces are 16 percent more productive and 18 percent more likely to stay at their organization. Connected workspace initiatives can help facilities managers and space planners:

- Gain insight into room usage
- Understand technology preferences
- Ensure right workspaces are available
- Increase employee productivity and satisfaction

Business Leaders Expect External Partners to Deliver Important Benefits

Most facilities and IT teams will work with external vendors that specialize in designing, building, and managing communication and collaboration spaces. These relationships
can accelerate connected workplace initiatives and provide many important benefits. The respondents to our survey identified several benefits they expect from their external partners.

When we look at respondents by company size, the top expected benefit for companies with 250-999 employees and 1,000+ employees is to reduce the burden on IT (56 percent), closely followed by faster resolution of technical issues for larger companies. Mid-size companies give equal importance to resolving technical issues and improving operations.
