

# Taylor Transloading

## Our Processes

1

Products arrive at the rail in containers.

### What is Transloading?

Transloading is the process of moving a shipment from one mode of transport to another (e.g., from intermodal to flatbed).

2

Taylor then transports the container from the rail to our warehouse.

3

We then take the products from the container to transfer onto a different mode of transportation, in this case, from container to flatbed.

4

The product has then been transferred from container to flatbed, and Taylor will transport it to the customer's desired location.
