A NEW ERA OF LAW ENFORCEMENT

We introduce the world's first portable drug screening device,
designed to detect illicit narcotics onsite
with no officer exposure.

WWW.TACTISCAN.COM

TACTISCAN

A re-usable pocket-sized narcotics scanner for police patrols bringing new levels of safety and efficiency to police field work.

TactiScan allows police officers to detect the most commonly used illicit narcotics onsite without officer exposure. Compared to the methods currently in use, TactiScan is considerably safer and faster. An easy-to-use mobile app with its cloud connectivity leave no room for ambiguity, providing reliable data in just a matter of seconds.

TactiScan has an extremely high measurement accuracy from a low drug concentration and the user interface is significantly more functional than in the products currently used in fieldwork. The device currently detects cocaine, heroin, methamphetamine and, in the nearby future, fentanyl. New analogues can be added as they are recognized, and even "designer drugs" can be added to the scanning library before they become widespread.

As the TactiScan is re-usable and more than 20 times less expensive than its alternatives, it is affordable for any sized police department. The acquired test results are completely secure and logged instantly for record keeping, and can be examined only by necessary officials in local police departments.

TECHNOLOGY

Groundbreaking miniaturized infra-red technology

The core of the TactiScan narcotics scanner is a Spectral Engines' Near Infrared (NIR) spectral sensing module combined with mobile and cloud connectivity to enable fast mass data management.

NIR-spectrometers are widely used in many fields to measure material content and have a proven track record in getting highly accurate measurement data in laboratory conditions. TactiScan brings narcotic screening from the laboratories to the field in a cost-effective, portable platform. Optical reading requires no sample preparation and does not alter the sample in any way, preserving even small sample amounts and reducing the risk for unnecessary exposure.

	Tacti-Scan	Test kits	Raman devices
Scans through bags	X		X
No need for sample preparation	X		X
Works for dark samples (i.e. heroin)	X	X	
Does not destroy the sample	X		X
No need for chemical reagents	X		
Fast analysis time	X		
Low-cost analysis	X	X	

In some cases Raman devices need sample preparation, i.e. when dealing with heroin. This increases the risk of sample contamination and unnecessary officer exposure.

Safety

No officer exposure, no sample destruction, no mistakes

Efficiency

No sample preparation, rapid results, unlimited tests with one device

Accuracy

High measurement accuracy from a low drug concentration
