

Comprehensive real-time flight status via APIs

Flexible, easily consumed APIs

Keep travellers and businesses that serve them in the know

Provide personal, high-level customer service

Power airport systems with a single, integrated data feed

Powerful data that improves the travel experience

Flight Status APIs

- **Query Response** – Current flight status information delivered in easily readable XML. Data for an individual flight or all flights on an airline to/from specific airports. Whole airport query response for airports and integrators. Single query response for app data feeds and travellers.
- **Global Data Feeds** – A complete snapshot of all current flight statuses followed by changes to flight status on a continuous basis. Customers can pull data in a compressed tab delimited file or opt to get data pushed in an XML format. Scope of flights can be worldwide, by countries, by airport(s) or by airline(s).

Weather API

- Description and graphic depiction of weather at hundreds of cities around the world delivered on a periodic basis. Includes current weather (precipitation, etc.) and temperature.

Airport Delay API

- Continually updated delay status information on inbound and departing flights at hundreds of airports. (North America only)

“OAG’s data enables us to push proactive flight status updates directly to customers’ mobile devices. The partnership has improved our service & increased our in-trip stickiness with travellers.”

Yang Wei, Qunar, CEO, Ticketing Business Group

Qunar using flight data API on its app to push mobile flight status change alerts to travellers
