Savvy Database Management Lets SalesLoft Equip Sales Teams With Sophisticated Tools, So They Can Win More Deals

“ VividCortex’s Profiler tool for query comparison allows us to immediately rule out infrastructure, hosting provider, and network latency as the root cause of a performance problems. ”

Mike Shepet

Director of Site Reliability Engineering,
 SalesLoft

SalesLoft is an online sales engagement platform that helps companies execute outbound calls, emails, and social communications. Sales leaders use SalesLoft’s Sales Engagement Platform to track performance with detailed analytics, which measure sales rep activities and results. The platform integrates with Salesforce and synchronizes all rep activities with email solutions like MS Exchange and Gmail.

Using the Sales Engagement Platform, SalesLoft users can build workflows to create and share personalized email templates as well as track open and response rates. The sales dialer feature allows reps to quickly execute on call lists with a streamlined, online dialer. SalesLoft’s dashboard analytics allow sales leaders to track all their reps’ activities, to determine what messages and approaches are working. They can create leaderboards that rank reps’ overall efficiency and efficacy, based on metrics like reply and conversion rates.

SalesLoft’s platform is embedded in its clients’ sales processes, serving as an essential tool for reps and sales leaders who succeed in fast-paced, growth-oriented environments. Designed for heavy daily use, SalesLoft’s systems must consistently run at peak performance, so sales professionals can always be ready to close deals and continue to cultivate more. Its environment includes Ruby and JavaScript for development with backend databases that include Postgres, Redis, and ElasticSearch for high volume structured and unstructured search and analytics.

Challenges

Mike Shepet, SalesLoft's Director of Site Reliability Engineering, is one of the members of the engineering team that keeps SalesLoft's performance top-notch. He told us that before turning to VividCortex, "The monitoring tool we were using didn't give us full visibility into our database internals. It couldn't show us what else was going on in PostgreSQL when our systems started to slow down." There had been issues isolating poor queries that were hurting system performance.

When the SalesLoft engineering team pushes new features to production, they need to be able to quickly troubleshoot any issues that impact system performance. The performance measurement tools they used in the past were helpful but limited, unable to provide the level of granularity that SalesLoft's engineering team requires to pinpoint issues. They need precision in order to understand the frequency of various queries, to identify which queries take the most time overall, and to determine where teams should focus efforts to best optimize application performance.

Mike Shepet

Director, Site Reliability
Engineering, SalesLoft

“VividCortex is a great solution for engineering teams that don't have a dedicated DBA, because it allows developers to easily visualize the impact of changes, without relying on the DBA or sysadmin for feedback.”

Mike explained that SalesLoft's engineering team uses a continuous delivery approach, so reducing the mean time to repair database related incidents and changes is critical to minimizing any production issues. "When developers push code to production, they need immediate visibility into the impact of their changes," Mike said.

Solutions

SalesLoft began using VividCortex in order to see exactly how code changes affect its database. Mike and his team can look at VividCortex's Profiler to monitor and compare query performance over different time periods, including before and after code pushes. The engineering team isolates and addresses production issues much faster, frequently identifying and pushing a fix in under 30 minutes. They also take advantage of the AWS CloudWatch integration available within VividCortex, which Mike characterized as, "insanely useful."

“ While other products look at different components of the stack, VividCortex fills a key performance monitoring gap by focusing on deep integration with the database. ”

Mike Shepet

Director, Site Reliability Engineering, SalesLoft

With VividCortex's CloudWatch integration, SalesLoft gets a more extensive history of CloudWatch graphs. By going beyond the default two-week retention period, SalesLoft's engineering team visualizes trends over a more significant period of time. A longer historical view lets the team identify patterns in system utilization, so they can more accurately plan out and optimize system resources. Citing a specific example, Mike said his team had used historical analysis to identify how often they were creating temporary tables that consumed system resources.

Based on this analysis, SalesLoft was able to decrease its use of temporary tables by 90%, which allowed its engineers to reduce their instance sizes, saving substantial operational costs. Just as SalesLoft serves sales teams with the sophisticated tactics they need to close deals, SalesLoft's data platform requires a sophisticated monitoring solution--VividCortex ensures that Mike and his team can immediately track the impacts of code changes, even at the system's deepest levels.

VividCortex is the best way to improve your database performance, efficiency, and uptime. It is a secure, cloud-hosted platform that eliminates your most critical visibility gap, providing deep insights into production database workload and query performance. It measures the performance and resource consumption of every statement and transaction, then uses patented algorithms to analyze and surface relevant insights, so you can proactively fix future performance problems before they impact customers.
