

Pure Green – 100% Renewable Energy

Total Gas & Power is delighted to bring Pure Green energy to ESPO

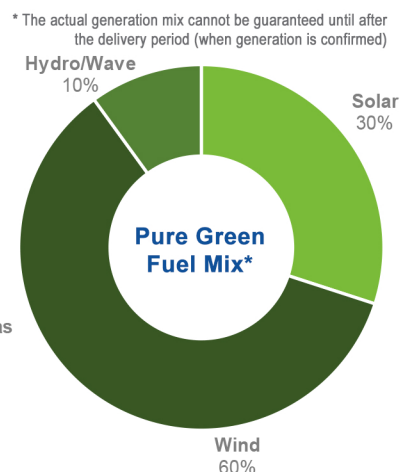

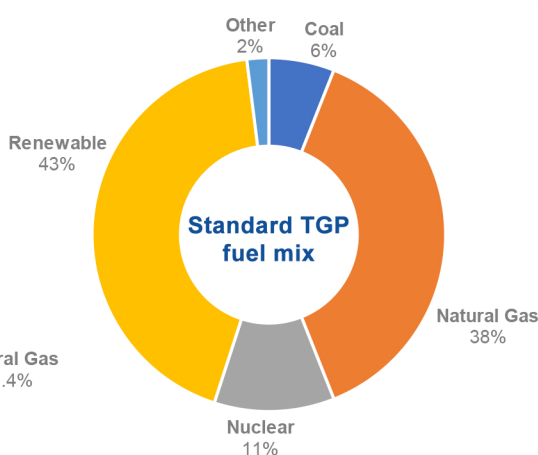

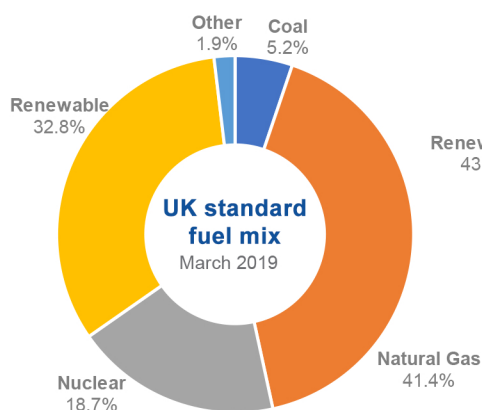

What is Pure Green?

To help ESPO with their commitment to environmental responsibility, 336GWh of Pure Green has been secured exclusively for ESPO customers at 0.075p/kWh (this charge will be reviewed annually and is subject to change). Pure Energy comes from 100% renewable sources (solar, wind, and hydro/wave) but doesn't include biomass.

Why Pure Green?

Using Pure Green energy means all participating ESPO customers can report zero emissions for electricity under the GHG Protocol Corporate Standards, Scope 2, as the electricity they use can be matched to Renewable Energy Guarantees of Origin (REGOs). We will provide certification of the renewable sources to any customers who request it.

How does Pure Green compare?

Total - Committed to Better Energy

In the decades ahead, renewable energies will play an increasingly important role as a supplement to fossil fuels. We estimate that renewables and hydraulic power will represent 20% of the global energy mix by 2035, compared to 13% in 2010. As an integrated energy company, we believe that working to develop new energies is both a strategic decision and an industrial responsibility for our Group. That includes solar, an abundant energy that is already competitive in nearly 20 countries. As a majority shareholder in SunPower (one of the world's leading companies in the solar industry), we are active across the entire photovoltaic value chain, from manufacturing cells to designing large-scale turnkey

solar power plants to installing residential or commercial solar panels.

Our commitment is to produce safer, cleaner, more efficient and more innovative energy.
