FEDERAL IT MODERNIZATION WATCH: WHO CAN SEE AMERICA'S WARFIGHTER LOGISTICS COMBAT SUPPORT INFORMATION?

Fairfax, VA – Technatomy Corporation, a leader in federal government systems integration for digital transformation initiatives, announces the successful version 18.1 release of the Defense Logistics Agency's (DLA) Account Management and Provisioning System (AMPS), DLA's Oracle-based, Identity Access Management (IAM) system.

AMPS offers the DLA centralized rule and role-based access controls serving multiple applications that support the efficient supply of our country's warfighters around the globe. Literally, AMPS authorizes 'who-can-see-what' data across DLA's complex logistics information systems through sophisticated end user authentication. The system's planned cloud migration assures the government of substantial cost savings, robust security and system availability.

Gregg Barr, Technatomy's Program Manager for AMPS, shared the dimensions and critical importance of the work involved:

"Recently, the version 18.1 release of AMPS marked a momentous achievement for DLA and our delivery team. We've helped the DLA create an identity access management capability beyond anything similar in existence today. In light of critical resource challenges, the customer conveys that they are 'very pleased' with our resourceful efforts in achieving this latest release."

Technatomy has been supporting the DLA AMPS development program since 2005. Technatomy Corporation CEO, Nadeem Butler, remarked:

"Across the federal landscape, there's the compelling need to modernize IT systems for growing cost and security factors. Our teams continue to deliver innovation and extraordinary quality, helping federal government managers achieve specific digital modernization objectives on time and within constrained budgets. We are committed

to these the success of our customers and to building trusted, lifelong beneficial partnerships with them.”

About Technatomy:

For nearly two decades, Technatomy Corporation has served the federal government as a system integrator focused on application development, program management and IT support in the health and civilian agency sectors. Today, the firm provides a breadth of digital transformation technologies, including codeless development, artificial intelligence/machine learning, blockchain, and enterprise security solutions.
