

THE WORK-FROM-HOME CYBERSECURITY GUIDE: **TOP 5 TIPS**

Many organizations are currently being challenged to support growing numbers of remote employees. Moving your employees out from behind the company firewall and onto devices that you may not be able to manage or control can bring new risks, but also has the potential to enhance flexibility, productivity and job satisfaction.

HERE ARE OUR **TOP FIVE TIPS** ON KEEPING YOUR EMPLOYEES SECURE WHEN THEY'RE WORKING FROM HOME:

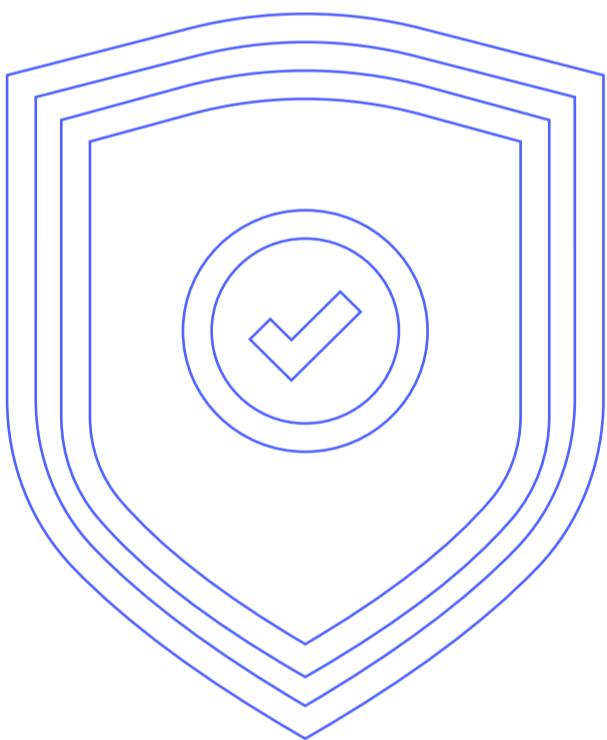

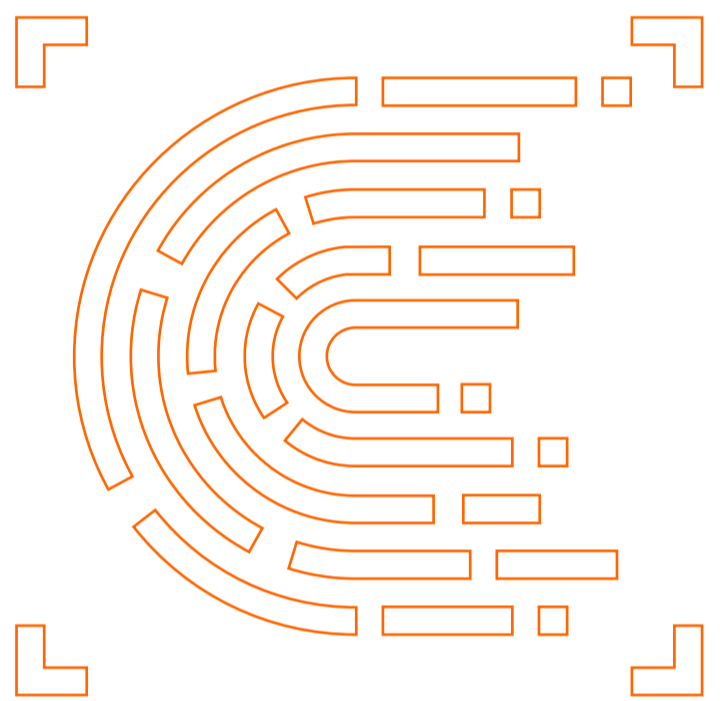

1. **KEEP CALM & CARRY ON.**

No matter the circumstances, technology should support your operations. Making radical changes in haste can lead to mistakes that aren't easy to repair. While it may be necessary to deploy new tools to enable remote productivity, exercise your usual caution and diligence when it comes to building and configuring your systems.

2. **DEVELOP SECURITY PLANS-BASED ONGOING ASSESSMENT OF YOUR RISK FOOTPRINT.**

There's no doubt about it: changing how employees access corporate IT resources means altering your risk profile. To keep pace with changes as they occur, you'll need to assess—and then re-assess again.

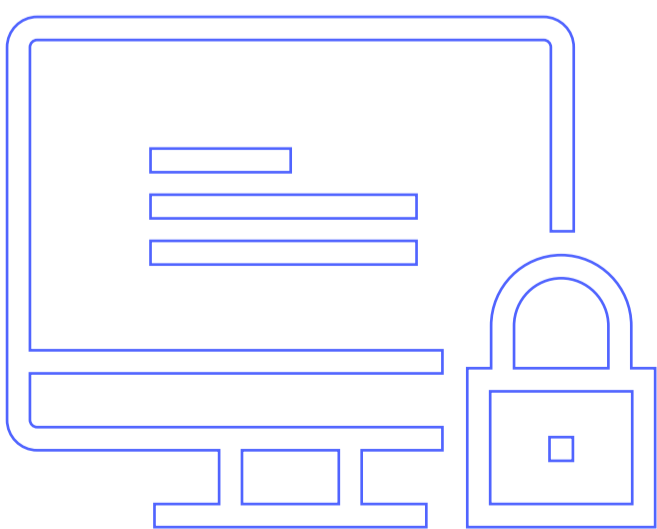

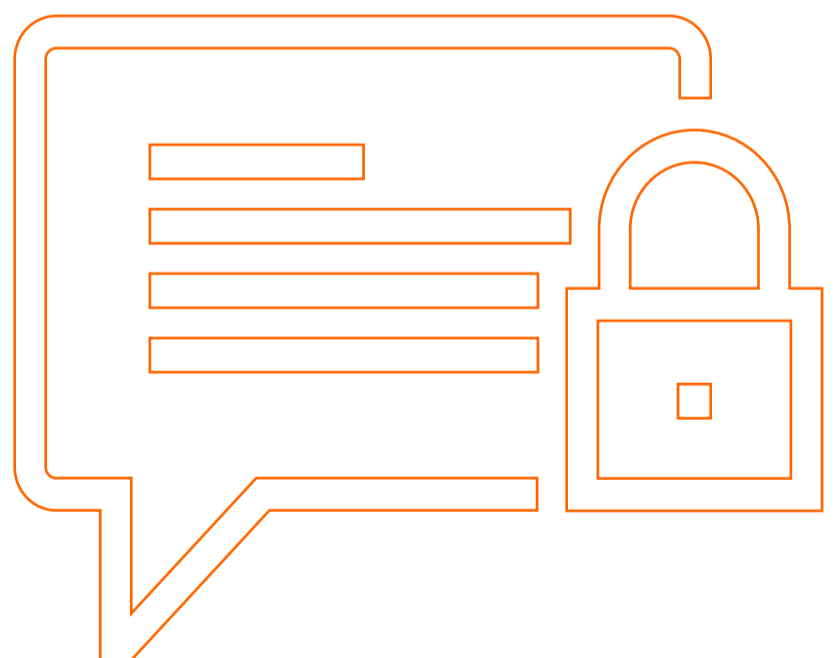

3. **STAY VIGILANT.**

Security monitoring can greatly enhance your ability to detect, investigate, and respond to threats quickly. What tools and policies do you have in place to enhance your ability to keep track of what your employees are up to? These can run the gamut from professional Managed Detection and Response (MDR) services to a simple employee questionnaire, but maintaining visibility is key to mitigating risks.

4. **COMMUNICATE CLEARLY AND OFTEN.**

One of the best ways to ensure that employees are adhering to your security policies is to ask them to do so. In times of organizational change, nothing is more important than communication. Want people to save files to the company OneDrive rather than personal device hard drives and folders? Tell them this and explain why. It's an opportunity to foster a workplace culture where information security is valued.

5. **DON'T NEGLECT SECURITY AWARENESS TRAINING.**

Formal or informal security awareness training programs can have a major impact on your risk profile. And they're inexpensive and easy to implement. If securing remote workers is a new challenge for your organization, enlist your employees' help by teaching them better security hygiene practices now.
