

## Using Denticon in Chrome

Although we recommend that Denticon users log into Denticon on Internet Explorer, Denticon is also compatible with Chrome. If you choose to utilize Chrome, please complete these important steps first.

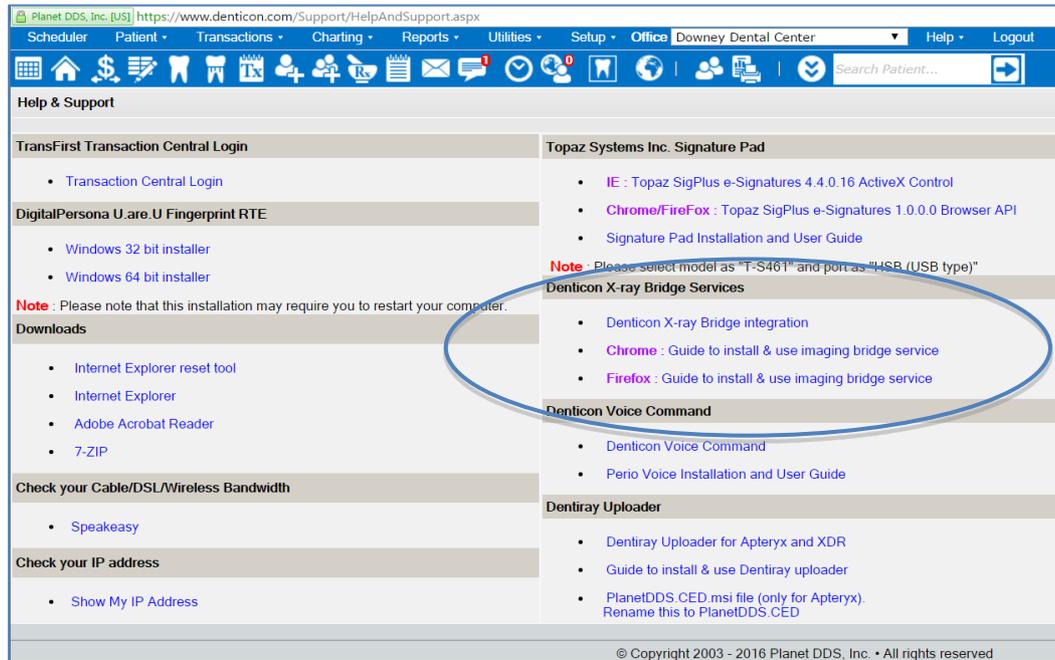

### Signature pad installation

- In Denticon, click Help > Help & Support from the top navigation ribbon
- Review the “Signature Pad Installation and User Guide” (Chrome instructions begin on page 8 of the document)
- Download the “Topaz SigPlus e-Signatures 1.0.0.0 Browser API”
- Run the downloaded “sigweb.exe” file and follow the setup instructions
- See screenshot below for location of the above-mentioned items

### X-Ray bridge services

- In Denticon, click Help > Help & Support from the top navigation ribbon
- Review the “Chrome: Guide to install & use imaging bridge service” document
- Download the Denticon X-ray bridge integration” file
- Run the downloaded “Denticon\_Bridge\_Service.msi” file and follow the setup instructions
- See screenshot below for location of above-mentioned items

## Document scanning

- The first time you scan a document using Chrome as your Denticon browser, Denticon will prompt you to download and run a new version of the Denticon-compatible scanning software
- Accept the prompt (shown in screenshot at right) and install the update
- You'll need to do this for every Denticon workstation

Note: the scanning interface for Chrome is more user-friendly than Internet Explorer's. The assorted tabs found in IE are consolidated in Chrome. And while the small thumbnails from IE aren't found in Chrome, you can scroll through scan previews before uploading the Document to Denticon.
