7 Things to Look For in Stock Control Software

Choosing the right stock management software isn't easy but if your solution ticks off all of these features, then you're on the right track!

1

✅ **Authority levels**

Assign authority levels to users of your software, so that only a stock manager can make permanent changes.

2

✅ **Barcode scanner**

If you have to input every item in the system manually, you have a spreadsheet, not a management software. Try a barcode scanner!

3

✅ **Analytics**

Save money by understanding which parts you use most often and order these in bulk, and prevent over-stocking the parts you don't use often + save on storage space.

4

✅ **Integrates with service management software**

Avoid double-data entry by integrating your job management software with your stock. Bonus points if they're part of the same system!

5

✅ **Works closely with suppliers**

When items are low or out of stock, your stock software can send an automatic purchase order to your supplier, ensuring you never lack essential parts.

PRICE

6

✅ **Cloud based**

More than ever, the office should be available to you everywhere. Cloud based software ensures that you're always flexible and able to treat challenges like opportunities.

7

✅ **Multi location system**

Vans are bound to become mini-storage units – it's time to accept it. A multi-location system means the stock software knows where an item is stored.

If you wanna see a solution that does everything listed above and more, check out **Commusoft's Stock Control feature!**
