

AgileCraft Tip Sheet

Launching a Lean Portfolio

Lean Portfolio Management helps large enterprises truly realize the promise of agility: that anti-fragile state that enables faster decision making and takes an economic viewpoint. It favors making hypothesis-driven decisions in order get to business outcomes in a taxonomy that allows you to look forward. This also brings about a greater level of participation and inclusion at the team level - the PMO is no longer the gatekeeper, and everyone is involved in the evolution of the delivery, so the behavior of teams and trains is being replicated at the portfolio level. It is about finding better ways to know that you are impacting the bottom line, that the right things are being built, consumed more quickly and getting continuous feedback from customers. It's about constantly assessing the value you expect to get, and the value achieved so that you can decide whether to pivot or persevere. To facilitate this, AgileCraft has created a playbook to fulfill your lean portfolio needs.
