Gravity Filters

Gravity filters are used for municipal water, wastewater, and industrial applications. Gravity is used to move the water through a filter bed made up of various types of media including sand, anthracite, greensand, and/or granular activated carbon, depending on a plant’s water treatment needs. When deciding between a pressure filter and gravity filter, consider that gravity filters are both easier to inspect and more economical. The hydraulic profile of the plant determines whether a pressure filter or gravity filter is better.

Why Choose WesTech?

WesTech has been designing gravity filters for well over 20 years, and with the acquisition of General Filter, now has a combined experience of over 80 years. WesTech is an employee-owned company that provides global municipal, industrial, and minerals clients with reliable and cost-effective process solutions for water treatment, liquids/solids separation, and biological treatment needs. For over 45 years, WesTech has collaborated closely with both customers and industry, delivering on project commitments in a way that meets company principles of integrity and quality.

Configurations

WesTech gravity filters are available in a variety of configurations and designs that can be customized to meet various constraints:

- Water quality, footprint, backwash requirements, and flow requirements can vary based on specific applications or a customer’s preference
- The filter designs can be either circular or rectangular
- Filters can be either single or multi-cell
- Systems can be designed for self-contained backwash storage, eliminating the need for backwash pumps
Backwash Systems

**Applications**

**Municipal**
- Surface and Ground Water Filtration
- Iron and Manganese Removal
- Tertiary Filtration

**Industrial**
- Cooling Tower Makeup Water
- Surface Water Treatment
- Plant Process Water

**Media Options**

- **Sand**
  - Commonly used in municipal and low turbidity applications

- **Anthracite**
  - Commonly used for arsenic removal

- **Greensand or Manganese ATHRA/SAND™**
  - Commonly used for manganese removal

- **Deep bed coarse media**
  - Commonly used in industrial and wastewater applications

**Underdrain**

- **MULTIBLOCK®**
  - Features a dual lateral design for even distribution during filtration and combined air-water backwashing processes
  - Utilizes the Laser Shield™ technology, a stainless-steel plate with laser cut slots for direct media retention
- **Flat Plate False Bottom** allows for ease of access to the media retaining nozzles for maintenance and allows the underdrain to be used to distribute backwash air
- **Header and Lateral** provides PVC or stainless steel design options with multiple choices for media retaining nozzles or perforated laterals

**Overdrain**

- **MULTIWASH®**
  - Combines air and water simultaneously for the duration of the backwash
  - Provides vigorous scouring action to clean the media, while specially designed wash trough baffles are used to eliminate media loss
- **Trough** allows for conventional process for air followed by backwash

**Tank Material Options**

- **Aluminum**: No paint, lower maintenance
- **Carbon Steel**: Most cost effective
- **Stainless Steel**: No paint, lower maintenance
- **Concrete**: Larger flows with fewer units

**Applications**

**Municipal**
- Surface and Ground Water Filtration
- Iron and Manganese Removal
- Tertiary Filtration

**Industrial**
- Cooling Tower Makeup Water
- Surface Water Treatment
- Plant Process Water
