SuperDisc™

Intelligent Design
Consisting of multiple rotating filter discs, the SuperDisc™ filter features a well-proven system that uses fine-woven filter media. This sophisticated design produces a highly effective filtration process that can achieve high filtration efficiencies.

How it Works
Water to be filtered is guided into the rotor drum and flows by gravity into the filter discs through openings in the drum, and passes through the filter media on the sides of the discs. Suspended solids are separated and accumulated on the inside of the filter disc panels.

From raw water screening to wastewater polishing, the SuperDisc™ filter delivers superior filtration performance for water, wastewater, and water reuse applications.

TDC Model

When the water level inside the filter rotor increases to a pre-set point, the filter rotor starts rotating and the backwash of the filter media starts. The high pressure backwash spray removes the accumulated suspended solids into the reject flume inside the filter. The suspended solids are then discharged via the reject pipe. The discs are submerged to approximately 65% and the water level of the filtrate is maintained by an integral outlet weir.

Two Versions, One Method
The SuperDisc™ filter is available as a freestanding unit with filter discs contained in a stainless steel tank and a version for installation in a concrete tank. The two versions have the same design regarding drive system, backwash system, outlet weir, disc cassettes, etc. The effective filter area can be up to 1,620.5 ft² per filter.
Superior Performance

Combining intelligent engineering with sophisticated technology, the SuperDisc™ filter offers a distinct advantage when it comes to filtration applications. Our unique design enables professionals in the water treatment industry to get maximum performance and reliability day-in and day-out.

SuperDisc Benefits

- Compact design, small footprint
- Quick replacement; fewer parts per disc
- The largest amount of filter area with up to 35 discs in one unit
- Level tank with long weir minimizes headloss and avoids need for outlet weirs in the civil construction
- Nozzles do not clog because backwash water is pulled directly from the filtered water level tank
- Fully automated operation
- Operates efficiently with 12-18 inches of headloss

Filtration Applications

- Effluent polishing of wastewater
- Phosphorus removal
- Raw water filtration
- Water reuse - Title 22 approved
- Process water filtration
- Cooling water filtration

Streamline Your Operation

WesTech provides start-to-finish system configurations with its line of proprietary products. These proven configurations can meet stringent requirements while increasing water recovery—ideal for municipalities and industrial facilities requiring complete water and wastewater package solutions.
