

Neschen AG – Important information

Why has Neschen AG decided to use PP films?

Neschen AG has decided to use PP films because of the decisive contribution this product can make to preserving nature and the environment for future generations. The declared goal is therefore to ensure **ecological sustainability** through the use of PVC-free materials.

The raw material polypropylene (PP) is recognized as an environmentally friendly alternative as it is a very simply structured synthetic material and also occurs as a "by-product" in the petrol industry. This resource is put to good use in the form of protection or mounting films.

Over the years, the company Neschen AG has developed alternatives on the basis of polypropylene for virtually every application (digital print, protection and mounting films).

The positive arguments for the use of products containing PP speak for themselves:

- ✓ **PVC free**
- ✓ **non-toxic combustion**
- ✓ **does not contaminate ground water**
- ✓ **virtually shrink-proof**
- ✓ **available in various thicknesses**
- ✓ **available with various different degrees of gloss and with different structures**
- ✓ **UV protection**
- ✓ **temperature resistant up to +100° C**

Most protection and mounting films supplied by Neschen AG are provided with a paper cover. This paper comes exclusively from responsible sources, that is from PEFC-certified suppliers. This also contributes significantly to ecological sustainability.
