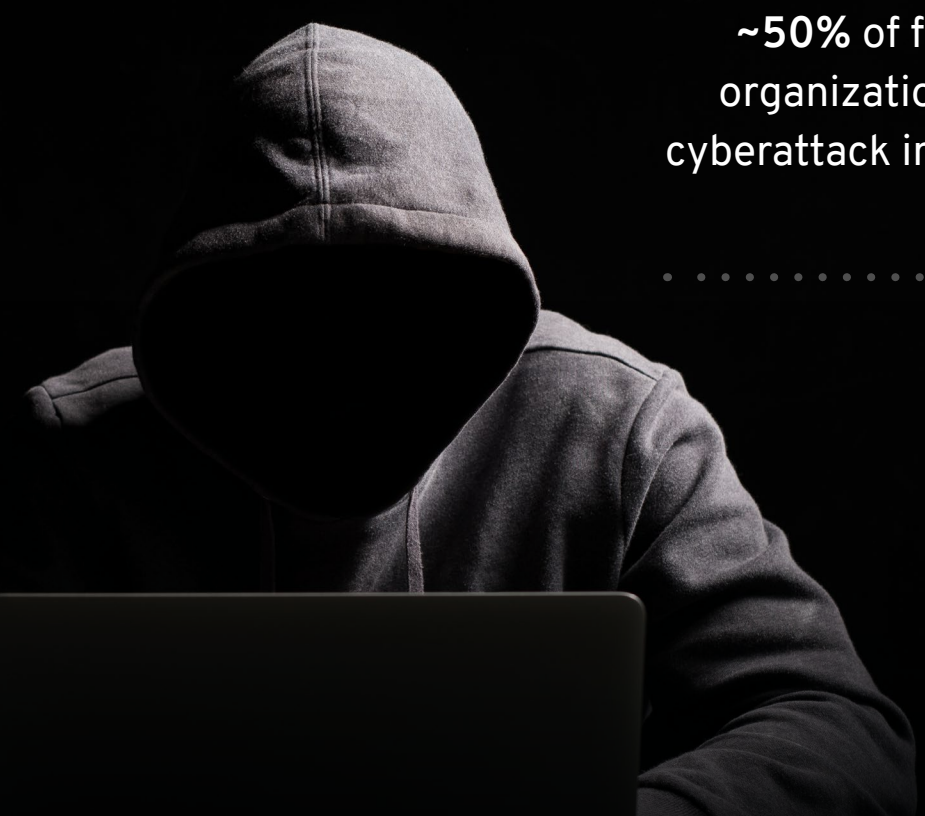
Cybersecurity Starts Here®

The State of Cybersecurity in the Financial Services Industry

The Ponemon Institute revealed that more than two-thirds of financial services organizations globally have experienced a cyberattack in their lifetime



~50% of financial services organizations experienced a cyberattack in the past 12 months

69% have experienced an attack in their organization's lifetime

47% of financial services organizations don't have a response plan for data breaches

66% agree that passwords are an important part of cybersecurity prevention, yet

53% **DO NOT** have visibility into their employees' password practices

NATURE OF ATTACKS

The 3 most common reported attack methods on financial services organizations are

phishing **(64%)**

web-based **(47%)**

malware **(37%)**

CYBERSECURITY SPENDING

<20% of the overall IT budget is dedicated to cybersecurity

40% believe they have an adequate budget for strong IT security

Financial services reporting requires access tracking, least-privilege controls and audit logs. Keeper enables role-based controls and visibility into shared credentials. Access logs to Keeper vaults can be audited for compliance or forensics, making reporting much easier for IT managers at financial institutions.
