

# Upgrade your lighting towers to LED

A retrofit LED light that can easily be exchanged, on site, with the metal halide lights on existing towers is now available from IWE Group.

Terry Parker, Managing Director of IWE Group, understanding the value of a lighting tower saw a gap in the market and decided to create a solution.

"With your 'bottom line' pivotal in all business decisions the move to LED will save you money. The energy efficiency of our lights will cut down your energy bill and reduce your carbon footprint. They will dramatically reduce your maintenance costs and each LED panel has a lifespan of 50,000 hours," Terry said.

"Our lights are built to last in extreme environments. They are durable and shock resistant and made with high quality materials. All fixings are marine grade stainless steel (316) and our chassis are built using aircraft grade aluminum.

"Our lenses are subjected to a 5kg drop test and the finished products are certified to stringent IP 66 standards. Lens are cast from optical grade glass and are self-cleaning.

"We recently developed a mobile application which gives complete control of your lighting tower from anywhere in the world. The remote application gives the power to activate lights, monitor battery and generator voltage, fuel levels, engine hours and gives warnings and alerts for any issues with the tower.

"How easy is it to convert your old metal halide lighting towers to LED?" Terry said.

"We have a simple system.

1. Disconnect and remove the old metal halide panel;
2. Mount your new LED panel using the existing mounting hardware;
3. Re-connect the LED panel using the existing wiring;
4. Turn it on.

IWE said it is easy to convert metal halide lighting towers to LED

"IWE Lighting panels have been used in towers since November 2014 and IWE works closely with our manufacturers to ensure excellence in light output, uniformity of colour and reliability."
