

Secure Cloud Migration for Apps & Data

Secure and streamline the process of cloud migration for your team by embedding applications with the security they need while they run, not after.

Companies are under increasing pressure to increase scalability, reliability, and recovery while cutting costs by migrating to cloud. Ensuring the security of this process is increasingly difficult, especially with complex environments.

Avocado enables safe, secure cloud migration across a variety of supported and tested environments, including:

- Azure, AWS, Oracle, Google Cloud, MongoDB, and more
- Hybrid and Multi-Cloud support
- EC2, Lambda, and Docker Hosts

Ensure compliance with PCI, PII, HIPAA, and more **as you scale**, instead of after. Avocado eliminates the needs for expensive hardware or add-on services, while simplifying major IT challenges.
